Notice

Information contained in this document is believed to be accurate and reliable at the time of printing. However, due to ongoing product improvements and revisions, AudioCodes cannot guarantee accuracy of printed material after the Date Published, nor can it accept responsibility for errors or omissions. Updates to this document and other documents as well as software files can be viewed by registered customers at http://www.audiocodes.com/downloads.

Date Published: June-27-2017

Trademarks

WEEE EU Directive

Pursuant to the WEEE EU Directive, electronic and electrical waste must not be disposed of with unsorted waste. Please contact your local recycling authority for disposal of this product.

Customer Support

Customer technical support and services are provided by AudioCodes or by an authorized AudioCodes Service Partner. For more information on how to buy technical support for AudioCodes products and for contact information, please visit our Web site at www.audiocodes.com/support.

Document Revision Record

LTRT	Description
13120	Initial document release for Version 7.2.
13121	Inserted link to interface description. Modified supported coders.
13122	Added 'Broken Connection Mode' and 'RTP Redundancy Mode'.

Documentation Feedback

AudioCodes continually strives to produce high quality documentation. If you have any comments (suggestions or errors) regarding this document, please fill out the Documentation Feedback form on our Web site at http://www.audiocodes.com/downloads.

1 Introduction

This Configuration Note describes how to set up AudioCodes Enterprise Session Border Controller (hereafter, referred to as *E-SBC*) for interworking between 8BVodafone DE "IP Anlagen-Anschluss"'s SIP Trunk and Microsoft's Skype for Business Server 2015 environment.

You can also use AudioCodes' SBC Wizard tool to automatically configure the E-SBC based on this interoperability setup. However, it is recommended to read through this document in order to better understand the various configuration options. For more information on AudioCodes' SBC Wizard including download option, visit AudioCodes Web site at http://www.audiocodes.com/sbc-wizard (login required).

1.1 Intended Audience

The document is intended for engineers, or AudioCodes and 8BVodafone DE "IP Anlagen-Anschluss" Partners who are responsible for installing and configuring 8BVodafone DE "IP Anlagen-Anschluss"'s SIP Trunk and Microsoft's Skype for Business Server 2015 for enabling VoIP calls using AudioCodes E-SBC.

1.2 About AudioCodes E-SBC Product Series

AudioCodes' family of E-SBC devices enables reliable connectivity and security between the Enterprise's and the service provider's VoIP networks.

The E-SBC provides perimeter defense as a way of protecting Enterprises from malicious VoIP attacks; mediation for allowing the connection of any PBX and/or IP-PBX to any service provider; and Service Assurance for service quality and manageability.

Designed as a cost-effective appliance, the E-SBC is based on field-proven VoIP and network services with a native host processor, allowing the creation of purpose-built multiservice appliances, providing smooth connectivity to cloud services, with integrated quality of service, SLA monitoring, security and manageability. The native implementation of SBC provides a host of additional capabilities that are not possible with standalone SBC appliances such as VoIP mediation, PSTN access survivability, and third-party value-added services applications. This enables Enterprises to utilize the advantages of converged networks and eliminate the need for standalone appliances.

AudioCodes E-SBC is available as an integrated solution running on top of its field-proven Mediant Media Gateway and Multi-Service Business Router platforms, or as a software-only solution for deployment with third-party hardware.

This page is intentionally left blank.

2 Component Information

2.1 AudioCodes E-SBC Version

Table 2-1: AudioCodes E-SBC Version

SBC Vendor	AudioCodes
Models	▪ Mediant 500 E-SBC ▪ Mediant 500L Gateway & E-SBC ▪ Mediant 800B Gateway & E-SBC ▪ Mediant 1000B Gateway & E-SBC ▪ Mediant 2600 E-SBC ▪ Mediant 4000 SBC ▪ Mediant 4000B SBC ▪ Mediant 9000 SBC ▪ Mediant Software SBC (SE and VE)
Software Version	SIP_7.20A.002
Protocol	▪ SIP/UDP (to the 8BVodafone DE "IP Anlagen-Anschluss" SIP Trunk) ▪ SIP/TCP or SIP/TLS (to the S4B FE Server)
Additional Notes	None

2.2 Vodafone DE "IP Anlagen-Anschluss" SIP Trunking Version

Table 2-2: 8BVodafone DE "IP Anlagen-Anschluss" Version

Vendor/Service Provider	8BVodafone DE "IP Anlagen-Anschluss"
Protocol	SIP
Additional Notes	The following interface description was used for this interoperability test: https://www.vodafone.de/media/downloads/pdf/VF-IP-Anlagenanschluss-Schnittstellenspezifikation-V3.2.1.pdf

2.3 Microsoft Skype for Business Server 2015 Version

Table 2-3: Microsoft Skype for Business Server 2015 Version

Vendor	Microsoft
Model	Skype for Business
Software Version	Release 2015 6.0.9319.0
Protocol	SIP
Additional Notes	None

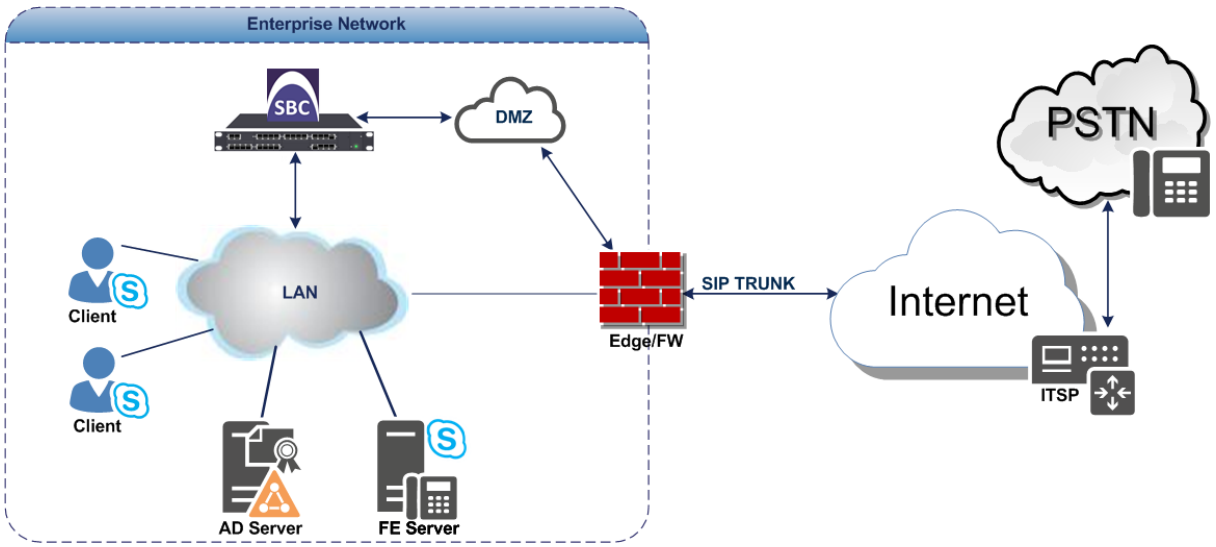
2.4 Interoperability Test Topology

The interoperability testing between AudioCodes E-SBC and 8BVodafone DE "IP Anlagen-Anschluss" SIP Trunk with Skype for Business 2015 was done using the following topology setup:

- Enterprise deployed with Microsoft Skype for Business Server 2015 in its private network for enhanced communication within the Enterprise.
- Enterprise wishes to offer its employees enterprise-voice capabilities and to connect the Enterprise to the PSTN network using 8BVodafone DE "IP Anlagen-Anschluss"'s SIP Trunking service.
- AudioCodes E-SBC is implemented to interconnect between the Enterprise LAN and the SIP Trunk.
  - **Session:** Real-time voice session using the IP-based Session Initiation Protocol (SIP).
  - **Border:** IP-to-IP network border between Skype for Business Server 2015 network in the Enterprise LAN and 8BVodafone DE "IP Anlagen-Anschluss"'s SIP Trunk located in the public network.

The figure below illustrates this interoperability test topology:

Figure 2-1: Interoperability Test Topology between E-SBC and Microsoft Skype for Business with 8BVodafone DE "IP Anlagen-Anschluss" SIP Trunk



2.4.1 Environment Setup

The interoperability test topology includes the following environment setup:

Table 2-4: Environment Setup

Area	Setup
Network	▪ Microsoft Skype for Business Server 2015 environment is located on the Enterprise's LAN ▪ 8BVodafone DE "IP Anlagen-Anschluss" SIP Trunk is located on the WAN
Signaling Transcoding	▪ Microsoft Skype for Business Server 2015 operates with SIP-over-TLS transport type ▪ 8BVodafone DE "IP Anlagen-Anschluss" SIP Trunk operates with SIP-over-UDP transport type
Codecs Transcoding	▪ Microsoft Skype for Business Server 2015 supports G.711A-law and G.711U-law coders ▪ 8BVodafone DE "IP Anlagen-Anschluss" SIP Trunk supports G.711A-law and G.711U-law coders
Media Transcoding	▪ Microsoft Skype for Business Server 2015 operates with SRTP media type ▪ 8BVodafone DE "IP Anlagen-Anschluss" SIP Trunk operates with RTP media type

2.4.2 Known Limitations

There were no limitations observed in the interoperability tests done for the AudioCodes E-SBC interworking between Microsoft Skype for Business Server 2015 and 8BVodafone DE "IP Anlagen-Anschluss" 's SIP Trunk.

This page is intentionally left blank.

3 Configuring Skype for Business Server 2015

This chapter describes how to configure Microsoft Skype for Business Server 2015 to operate with AudioCodes E-SBC.

Note: Dial plans, voice policies, and PSTN use are also necessary for enterprise voice deployment but are beyond the scope of this document.

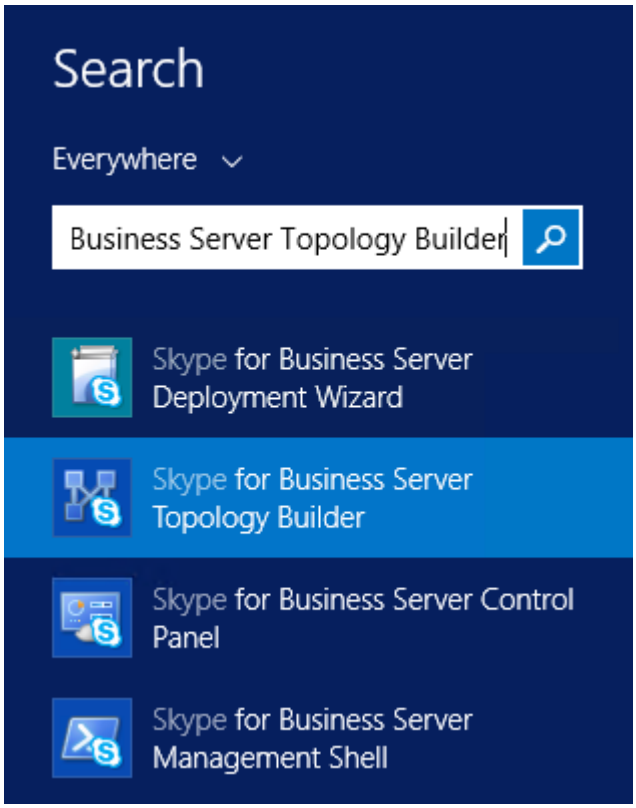
3.1 Configuring the E-SBC as an IP / PSTN Gateway

The procedure below describes how to configure the E-SBC as an IP / PSTN Gateway.

➢ **To configure E-SBC as IP/PSTN Gateway and associate it with Mediation Server:**

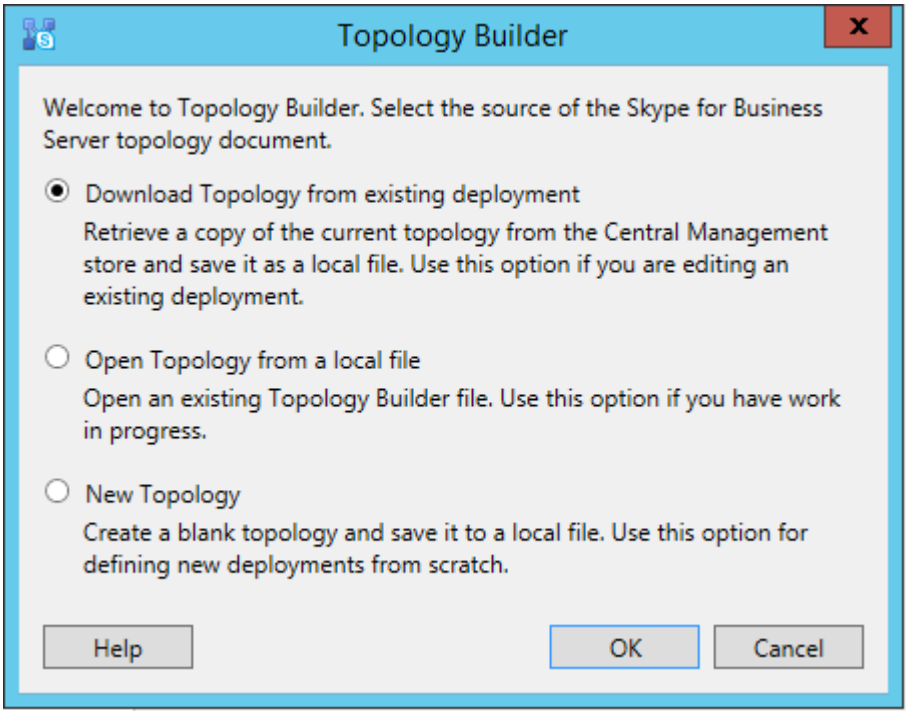
1. On the server where the Topology Builder is installed, start the Skype for Business Server 2015 Topology Builder (Windows **Start** menu > search for **Skype for Business Server Topology Builder**), as shown below:

Figure 3-1: Starting the Skype for Business Server Topology Builder



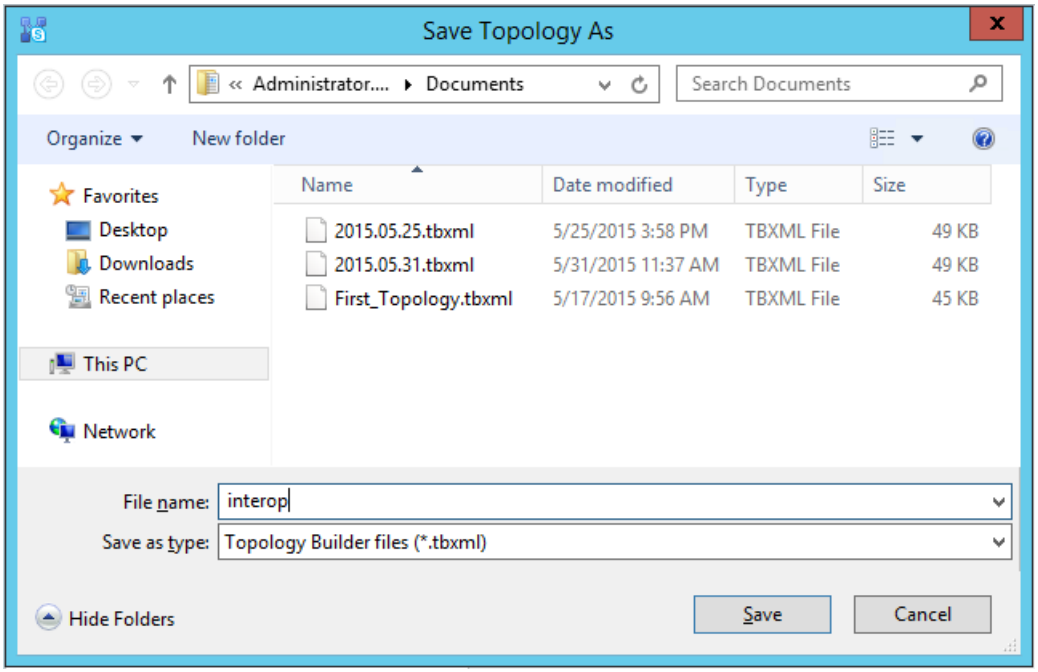
The following is displayed:

Figure 3-2: Topology Builder Dialog Box



2. Select the **Download Topology from existing deployment** option, and then click **OK**; you are prompted to save the downloaded Topology:

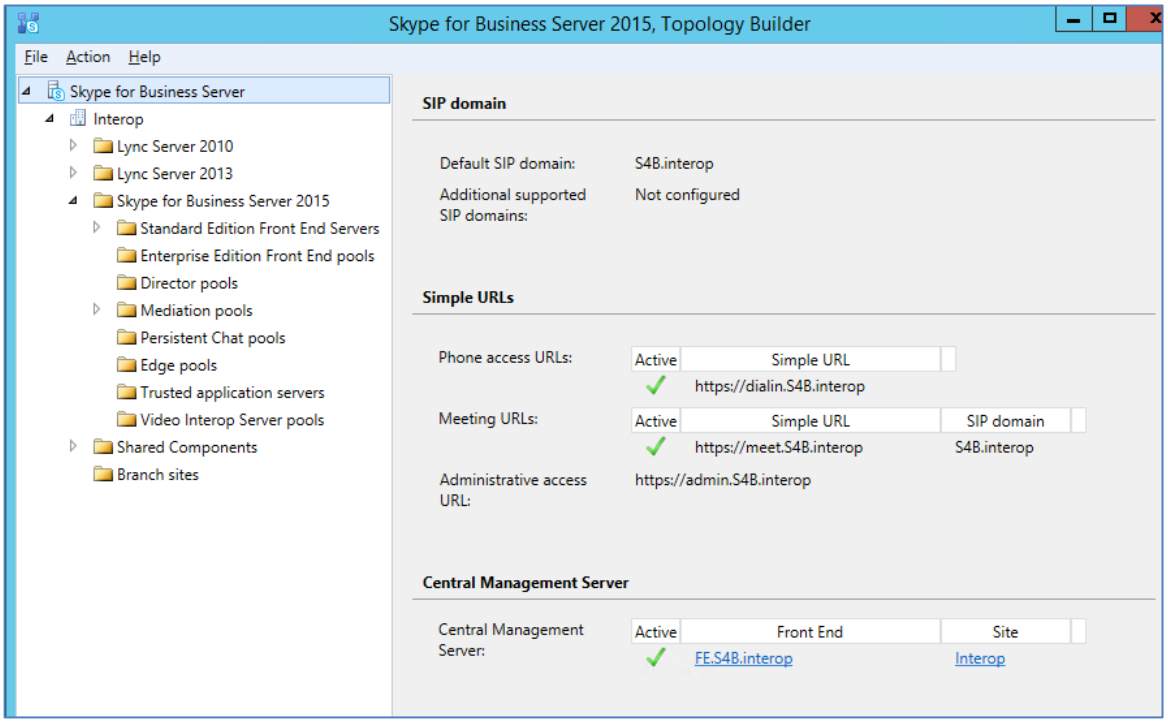
Figure 3-3: Save Topology Dialog Box



3. Enter a name for the Topology file, and then click **Save**. This step enables you to roll back from any changes you make during the installation.

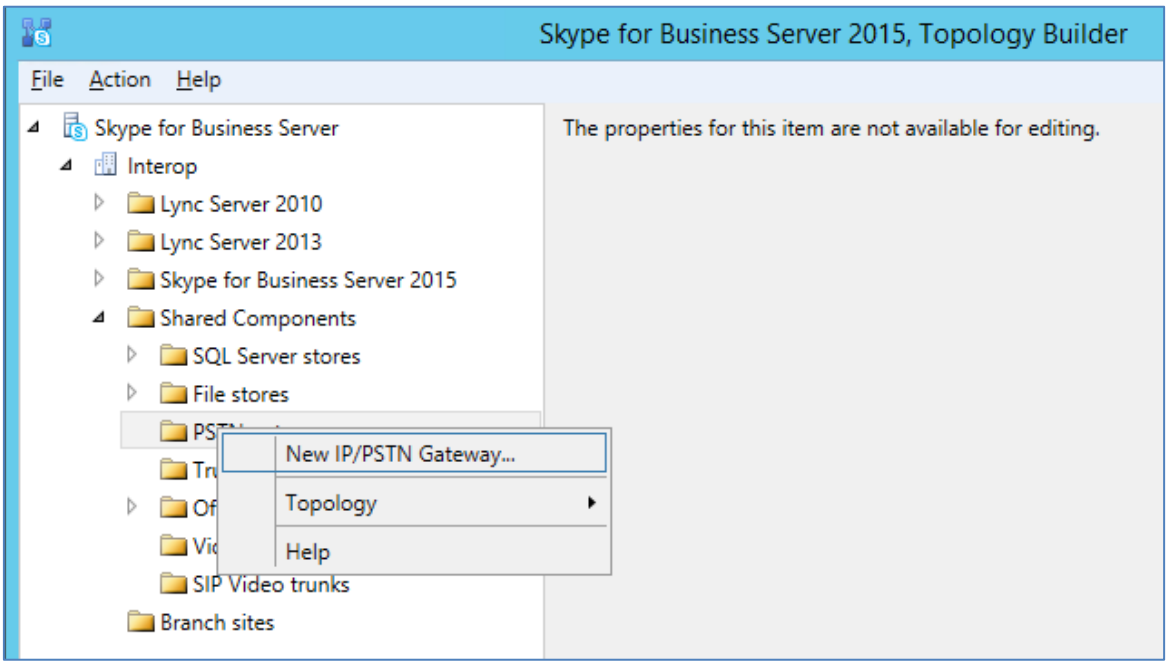
The Topology Builder screen with the downloaded Topology is displayed:

Figure 3-4: Downloaded Topology



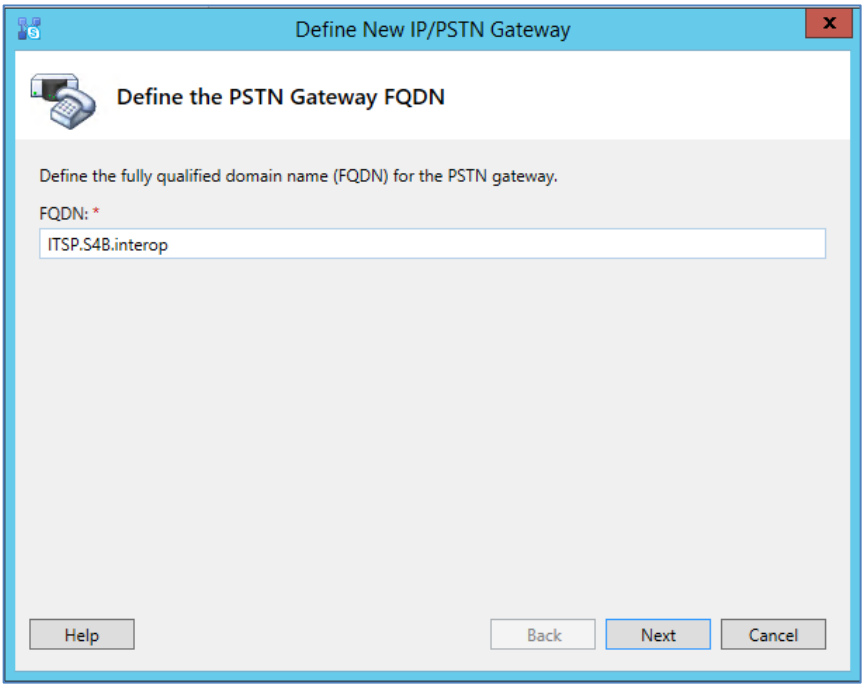
4. Under the **Shared Components** node, right-click the **PSTN gateways** node, and then from the shortcut menu, choose **New IP/PSTN Gateway**, as shown below:

Figure 3-5: Choosing New IP/PSTN Gateway



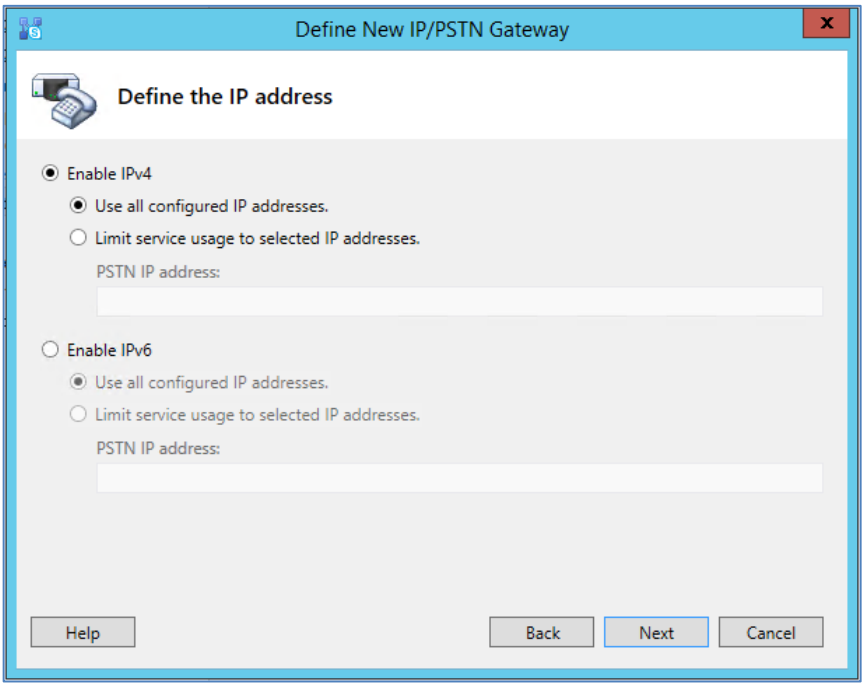
The following is displayed:

Figure 3-6: Define the PSTN Gateway FQDN



5. Enter the Fully Qualified Domain Name (FQDN) of the E-SBC (e.g., **ITSP.S4B.interop**). This FQDN should be equivalent to the configured Subject Name (CN) in the TLS Certificate Context (see Section 4.9.3 on page 56).
6. Click **Next**; the following is displayed:

Figure 3-7: Define the IP Address



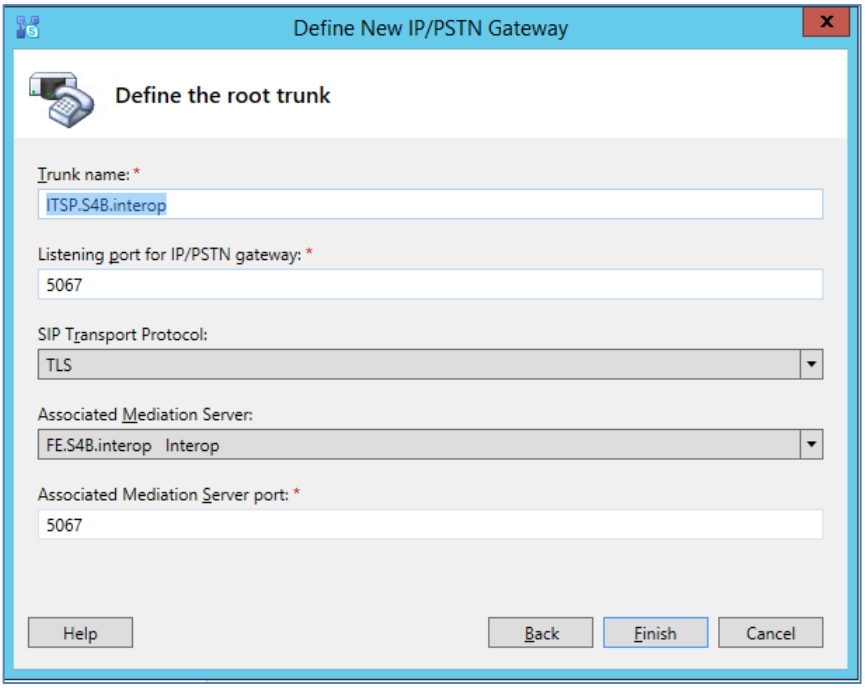
7. Define the listening mode (IPv4 or IPv6) of the IP address of your new PSTN gateway, and then click **Next**.
8. Define a *root trunk* for the PSTN gateway. A trunk is a logical connection between the Mediation Server and a gateway uniquely identified by the following combination:

Mediation Server FQDN, Mediation Server listening port (TLS or TCP), gateway IP and FQDN, and gateway listening port.

Notes:

- When defining a PSTN gateway in Topology Builder, you must define a root trunk to successfully add the PSTN gateway to your topology.
- The root trunk cannot be removed until the associated PSTN gateway is removed.

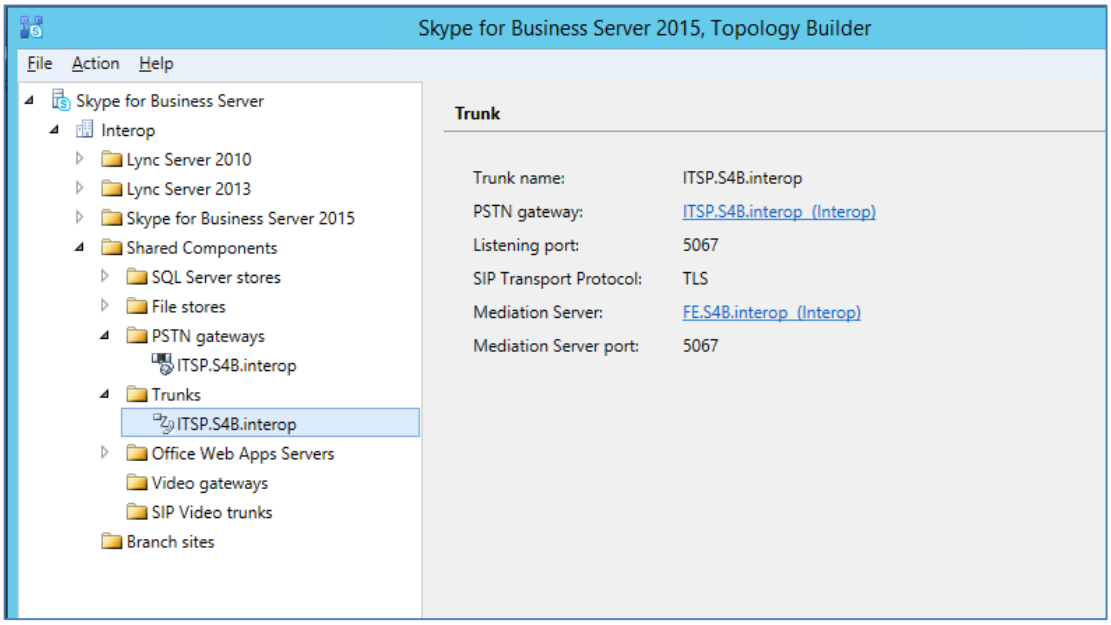
Figure 3-8: Define the Root Trunk



a. In the 'Listening Port for IP/PSTN Gateway' field, enter the listening port that the E-SBC will use for SIP messages from the Mediation Server that will be associated with the root trunk of the PSTN gateway (e.g., **5067**). This parameter is later configured in the SIP Interface table (see Section 4.3 on page 36).
b. In the 'SIP Transport Protocol' field, select the transport type (e.g., **TLS**) that the trunk uses. This parameter is later configured in the SIP Interface table (see Section 4.3 on page 36).
c. In the 'Associated Mediation Server' field, select the Mediation Server pool to associate with the root trunk of this PSTN gateway.
d. In the 'Associated Mediation Server Port' field, enter the listening port that the Mediation Server will use for SIP messages from the SBC (e.g., **5067**).
e. Click **Finish**.

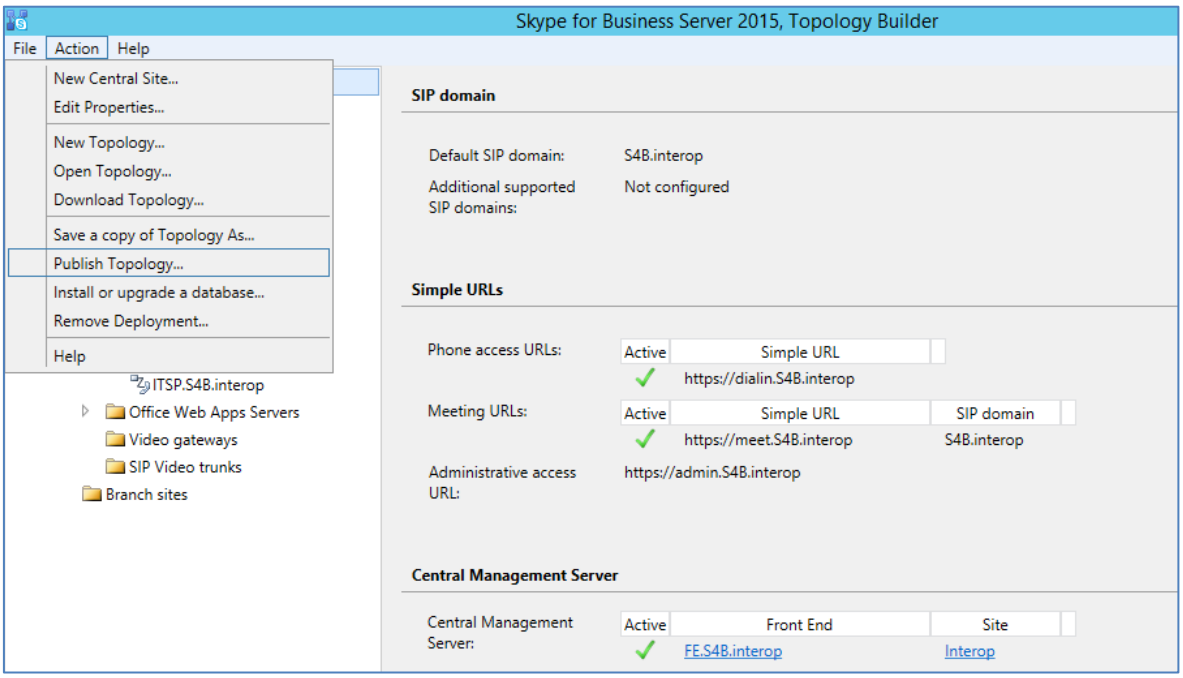
The E-SBC is added as a PSTN gateway, and a trunk is created as shown below:

Figure 3-9: E-SBC added as IP/PSTN Gateway and Trunk Created



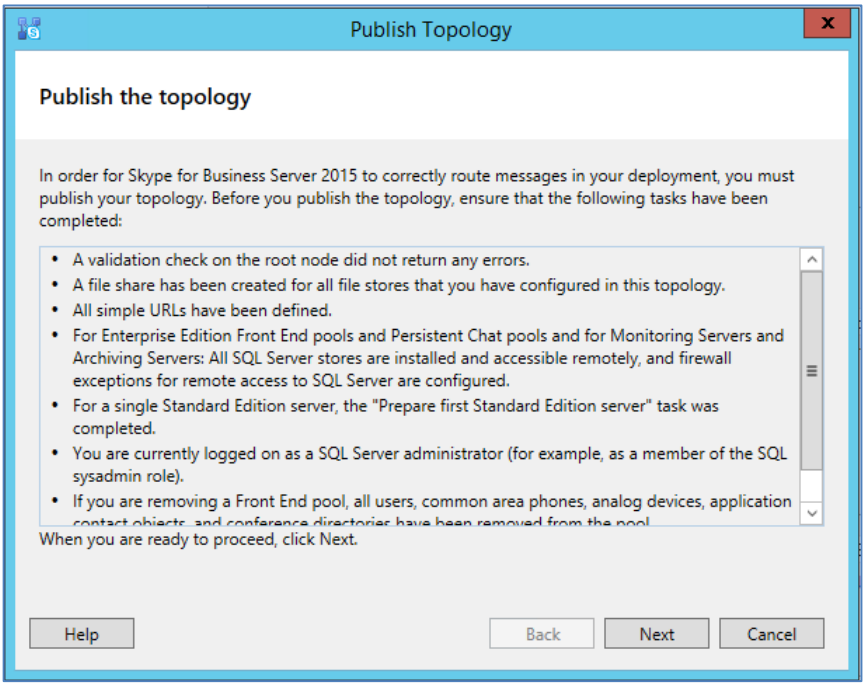
9. Publish the Topology: In the main tree, select the root node **Skype for Business Server**, and then from the **Action** menu, choose **Publish Topology**, as shown below:

Figure 3-10: Choosing Publish Topology



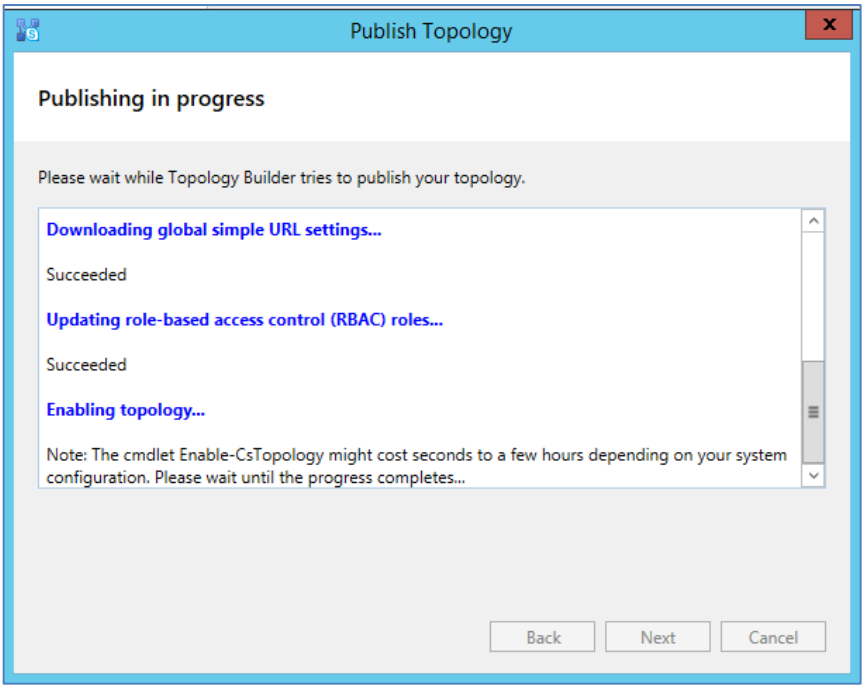
The following is displayed:

Figure 3-11: Publish the Topology



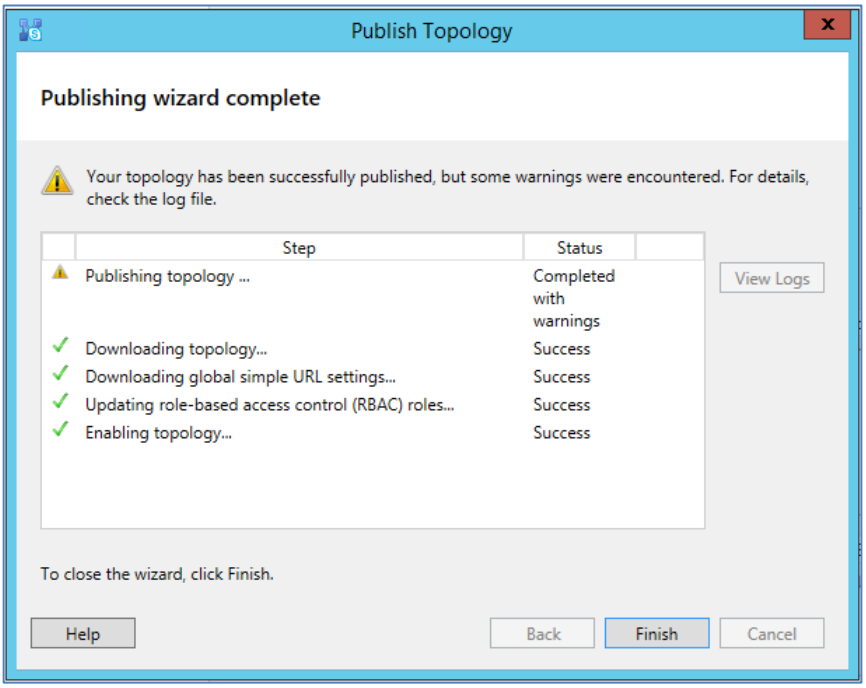
10. Click **Next**; the Topology Builder starts to publish your topology, as shown below:

Figure 3-12: Publishing in Progress



11. Wait until the publishing topology process completes successfully, as shown below:

Figure 3-13: Publishing Wizard Complete



12. Click **Finish**.

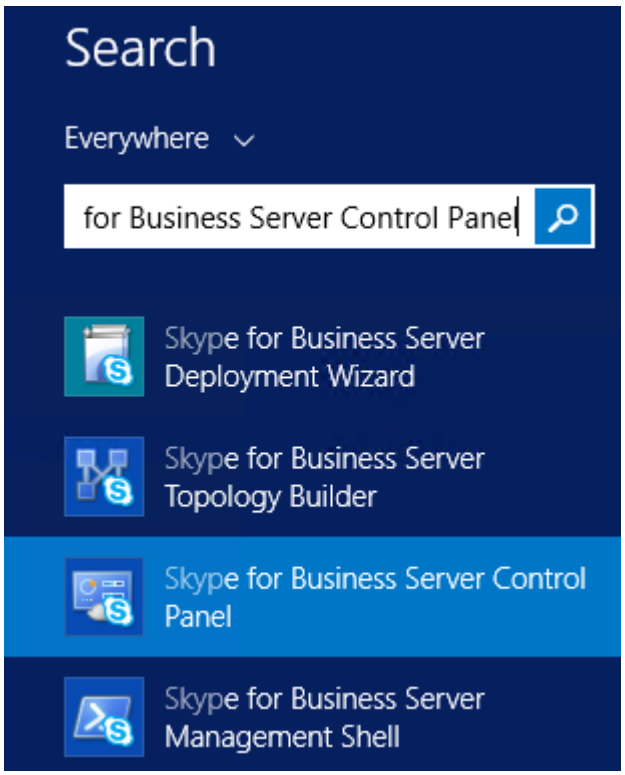
3.2 Configuring the "Route" on Skype for Business Server 2015

The procedure below describes how to configure a "Route" on the Skype for Business Server 2015 and to associate it with the E-SBC PSTN gateway.

➢ **To configure the "route" on Skype for Business Server 2015:**

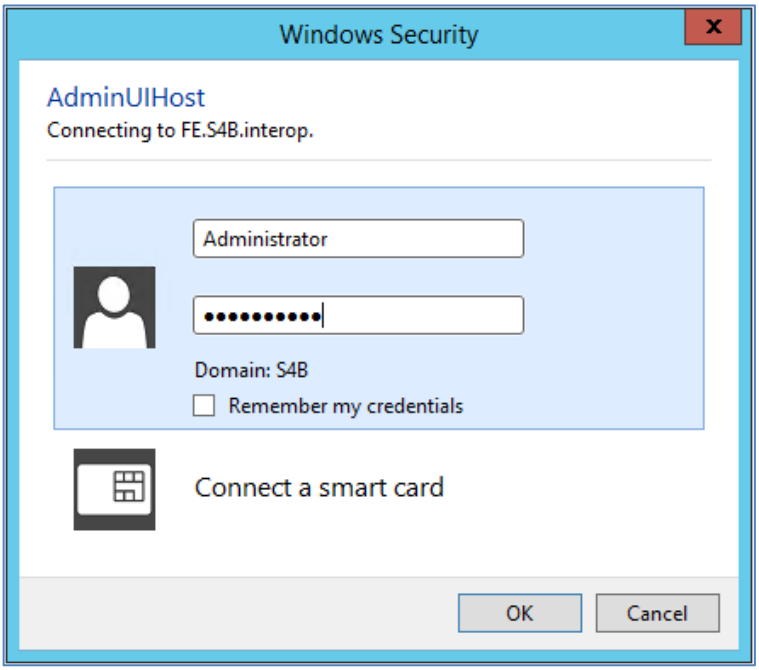
1. Start the Microsoft Skype for Business Server 2015 Control Panel (**Start** > search for **Microsoft Skype for Business Server Control Panel**), as shown below:

Figure 3-14: Opening the Skype for Business Server Control Panel



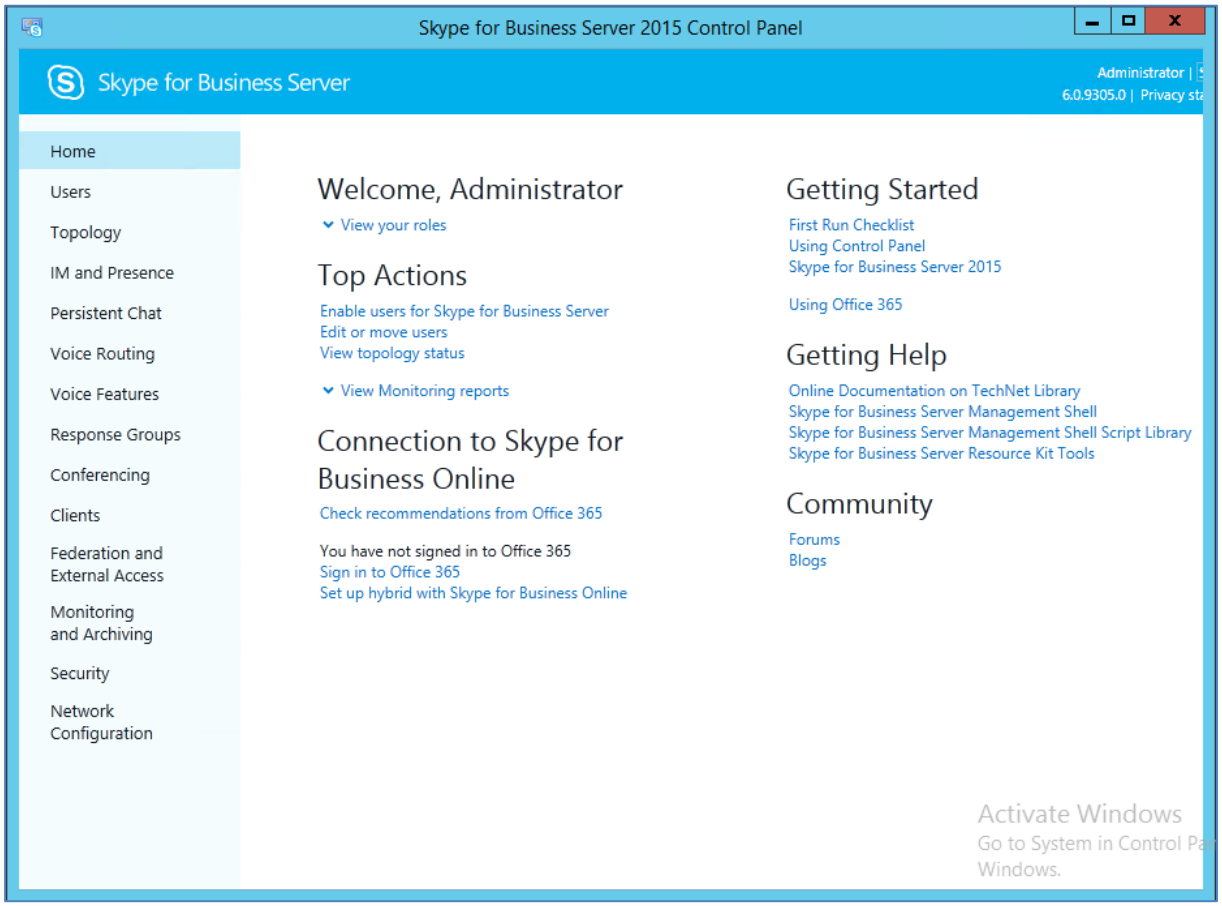
2. You are prompted to enter your login credentials:

Figure 3-15: Skype for Business Server Credentials



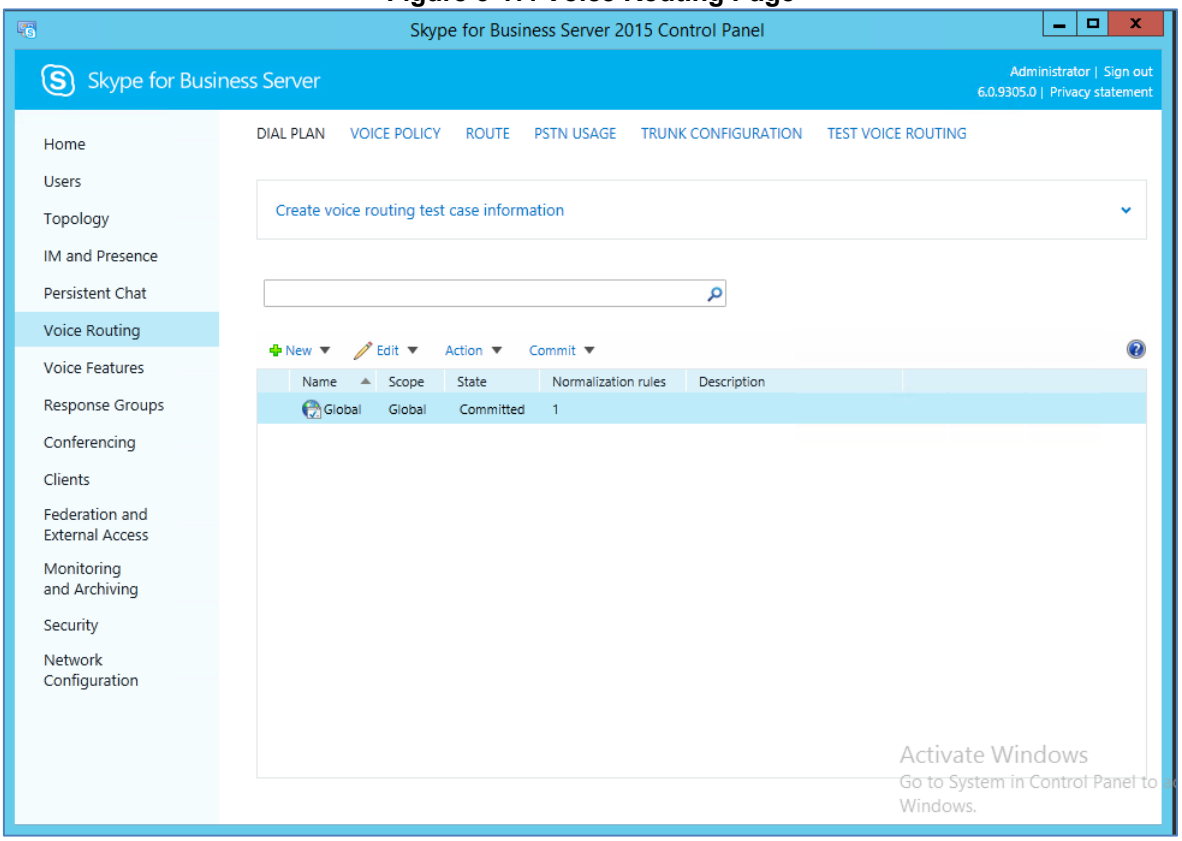
3. Enter your domain username and password, and then click **OK**; the Microsoft Skype for Business Server 2015 Control Panel is displayed:

Figure 3-16: Microsoft Skype for Business Server 2015 Control Panel



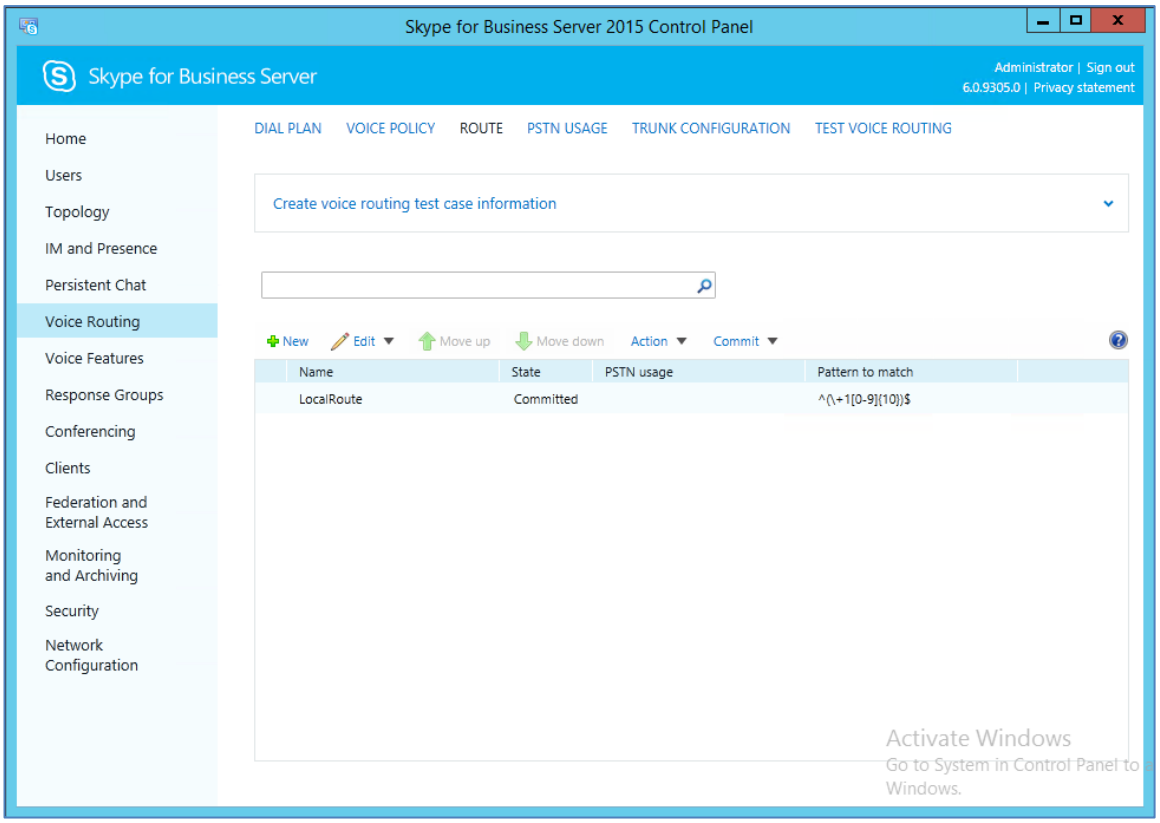
4. In the left navigation pane, select **Voice Routing**.

Figure 3-17: Voice Routing Page



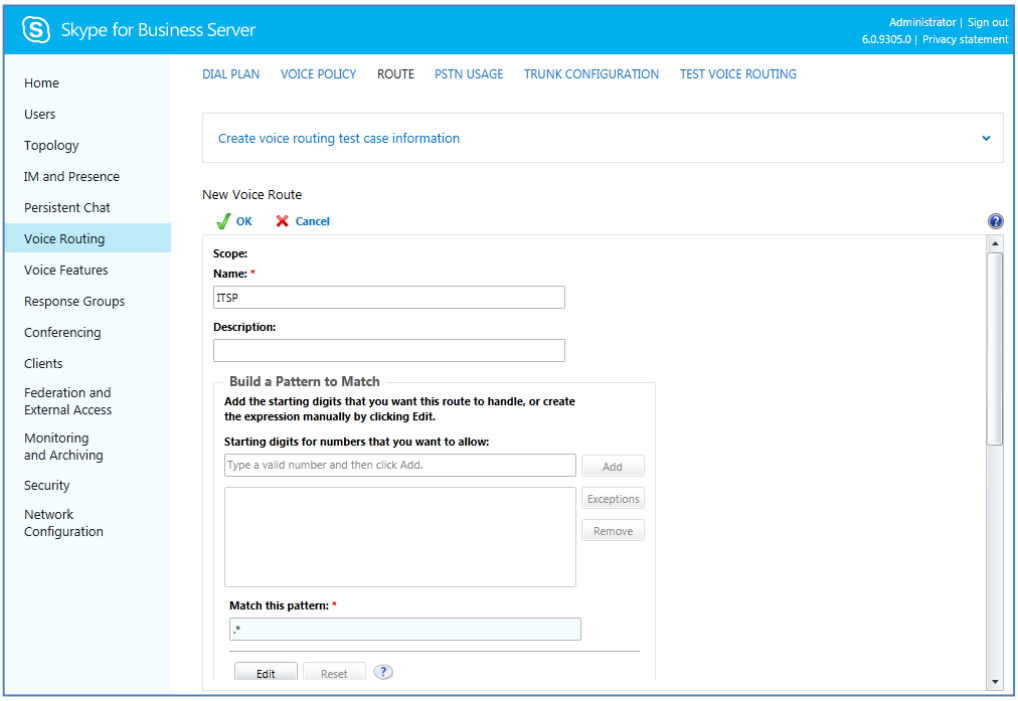
5. In the Voice Routing page, select the **Route** tab.

Figure 3-18: Route Tab



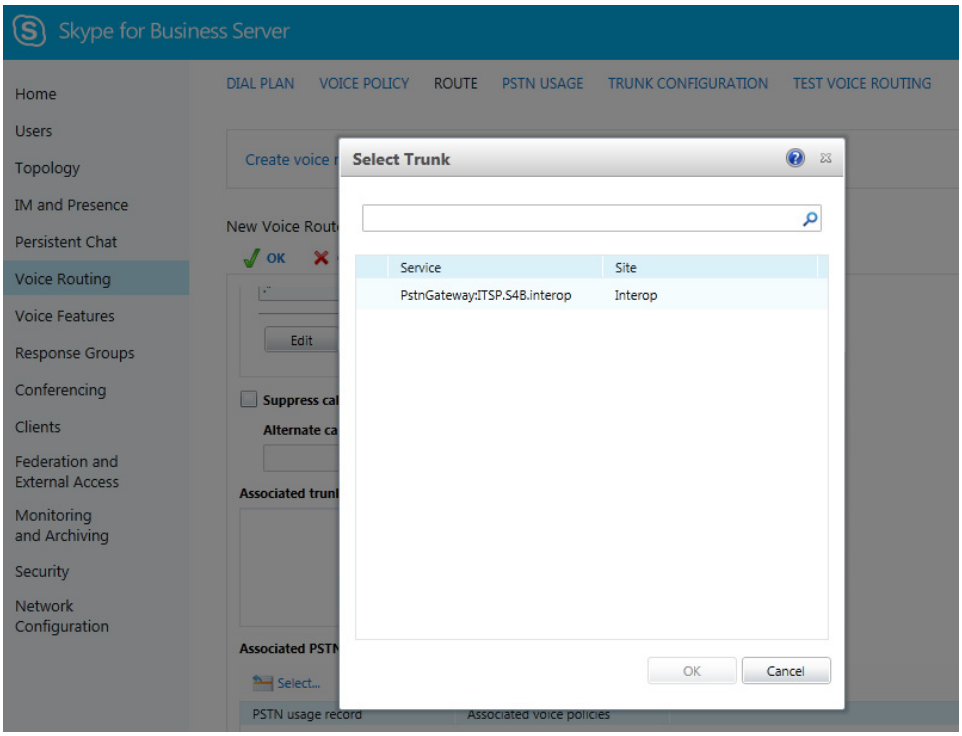
6. Click **New**; the New Voice Route page appears:

Figure 3-19: Adding New Voice Route



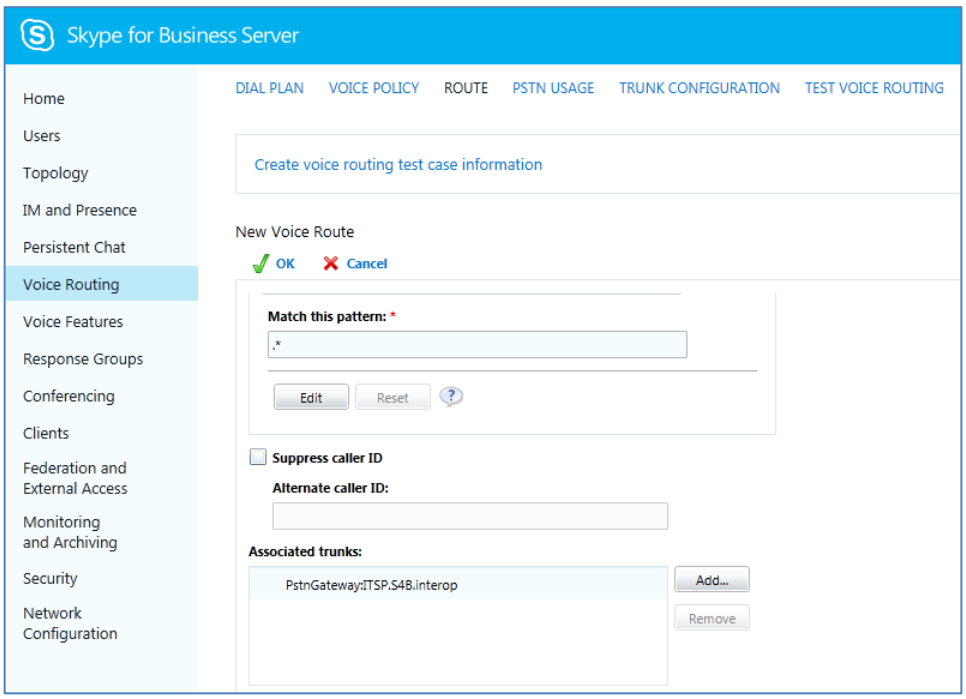
7. In the 'Name' field, enter a name for this route (e.g., **ITSP**).
8. In the 'Starting digits for numbers that you want to allow' field, enter the starting digits you want this route to handle (e.g., * to match all numbers), and then click **Add**.
9. Associate the route with the E-SBC Trunk that you created:
   a. Under the 'Associated Trunks' group, click **Add**; a list of all the deployed gateways is displayed:

Figure 3-20: List of Deployed Trunks



b. Select the E-SBC Trunk you created, and then click **OK**; the trunk is added to the 'Associated Trunks' group list:

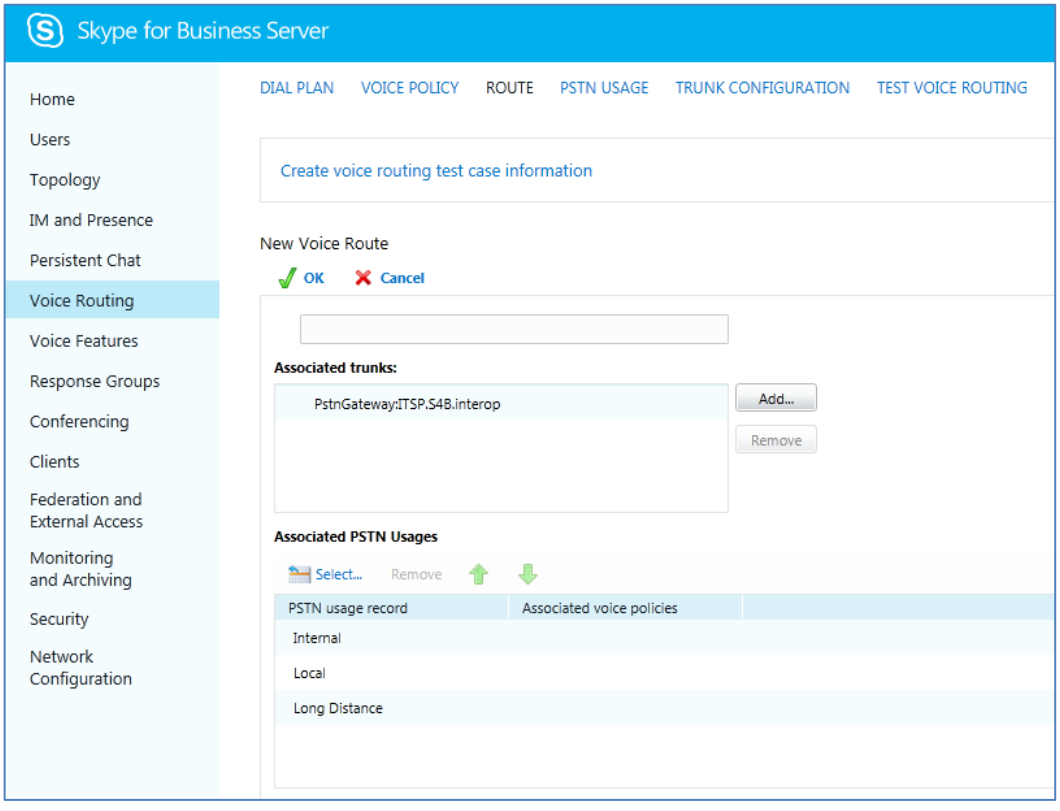
Figure 3-21: Selected E-SBC Trunk



10. Associate a PSTN Usage to this route:

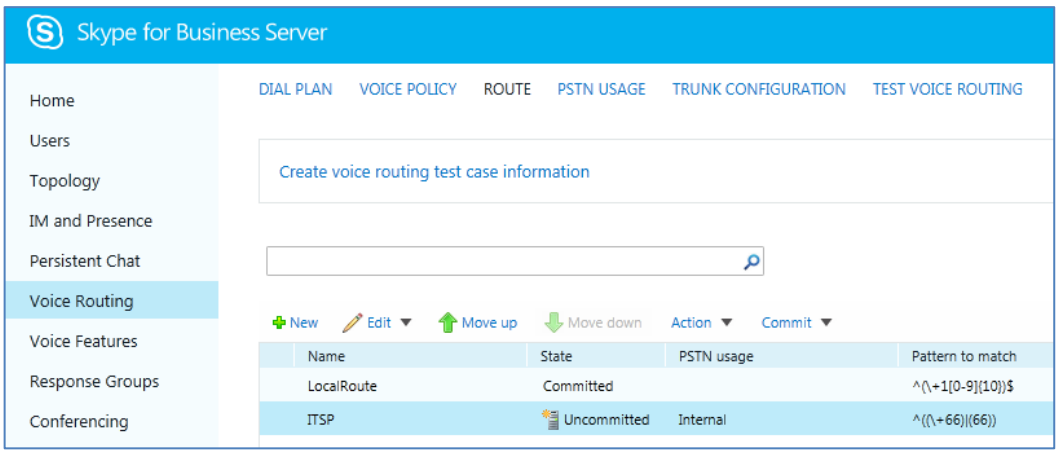
– Under the 'Associated PSTN Usages' group, click **Select** and then add the associated PSTN Usage.

Figure 3-22: Associating PSTN Usage to Route



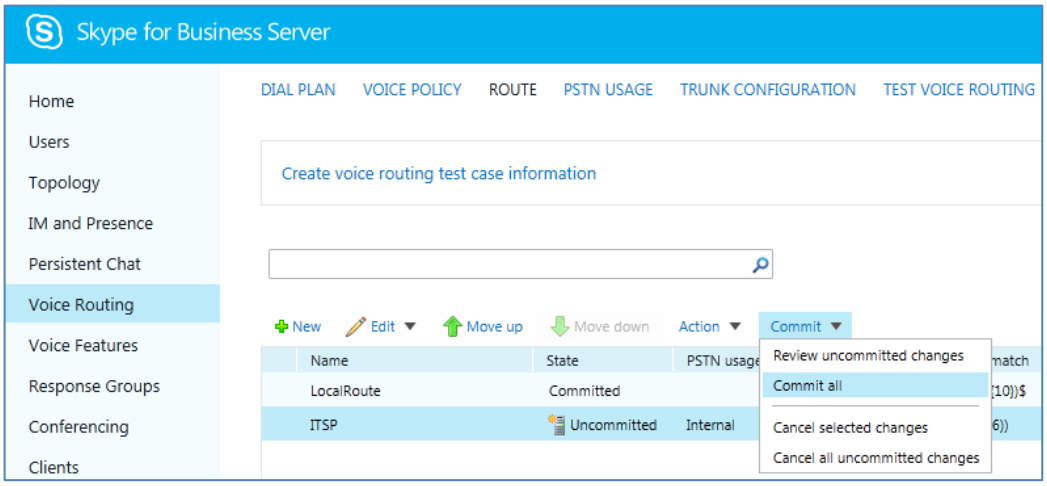
11. Click **OK** (located on the top of the New Voice Route page); the New Voice Route (Uncommitted) is displayed:

Figure 3-23: Confirmation of New Voice Route



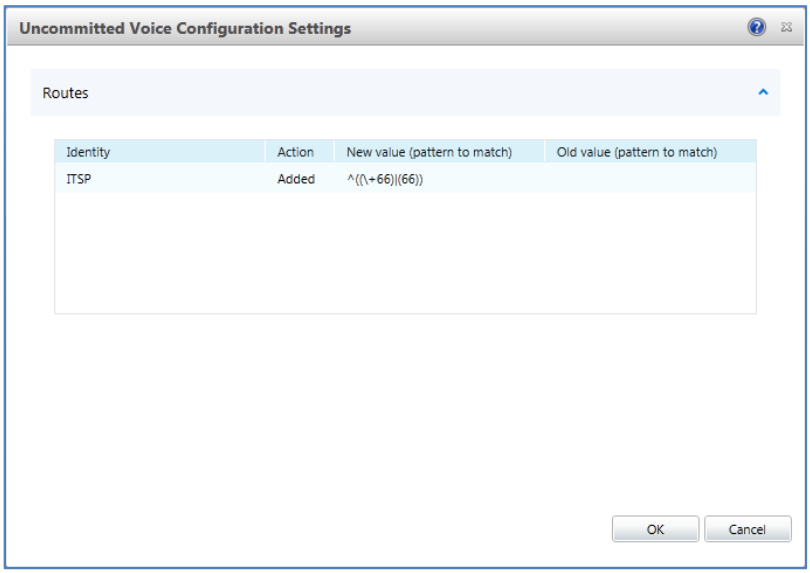
12. From the **Commit** drop-down list, choose **Commit all**, as shown below:

Figure 3-24: Committing Voice Routes



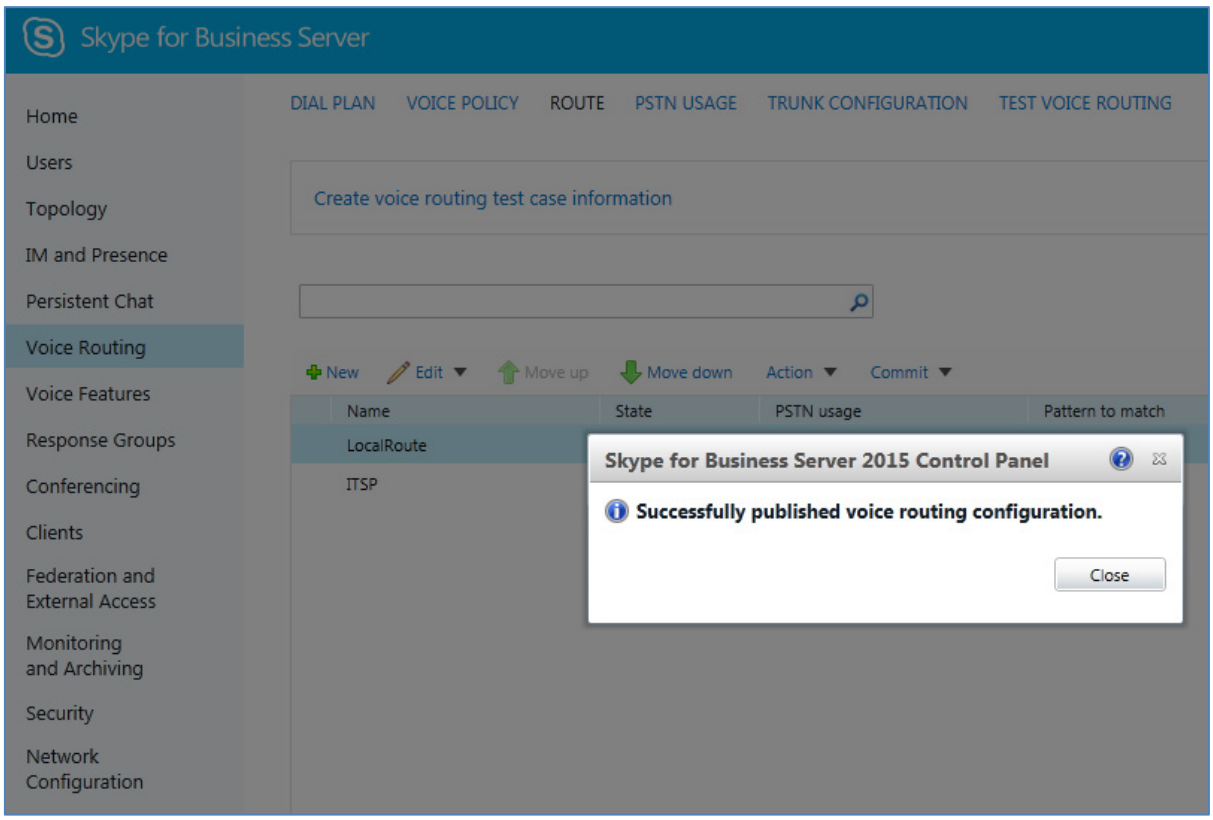
The Uncommitted Voice Configuration Settings page appears:

Figure 3-25: Uncommitted Voice Configuration Settings



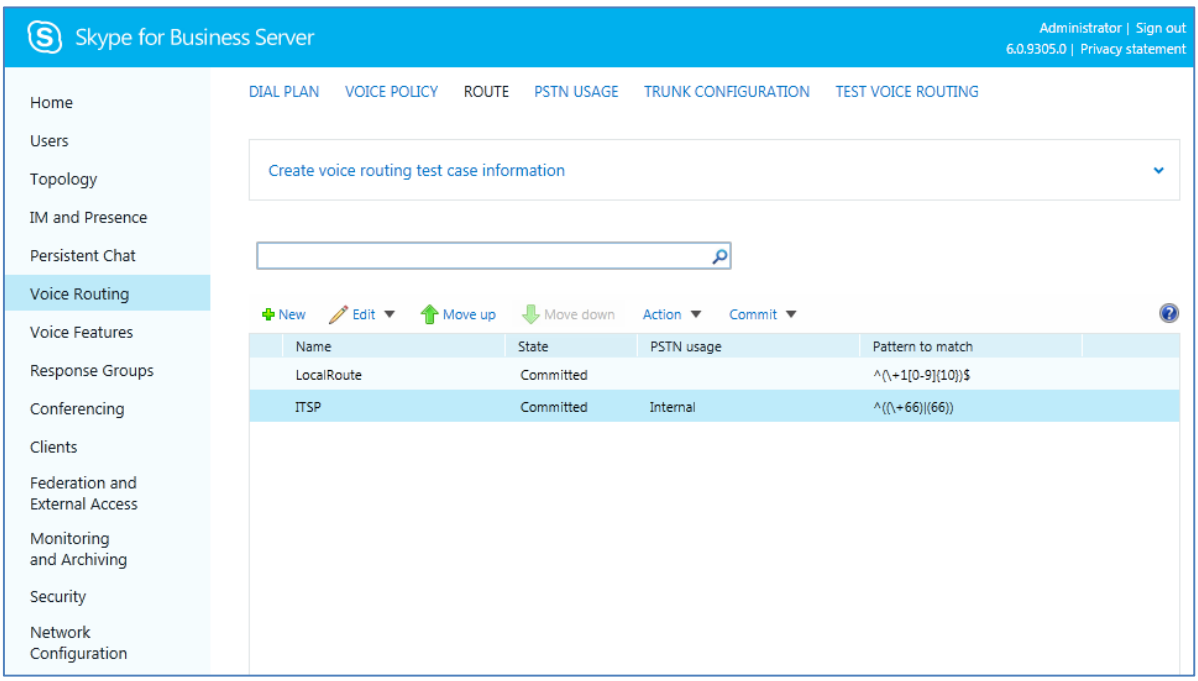
13. Click **Commit**; a message is displayed confirming a successful voice routing configuration, as shown below:

Figure 3-26: Confirmation of Successful Voice Routing Configuration



14. Click **Close**; the new committed Route is displayed in the Voice Routing page, as shown below:

Figure 3-27: Voice Routing Screen Displaying Committed Routes

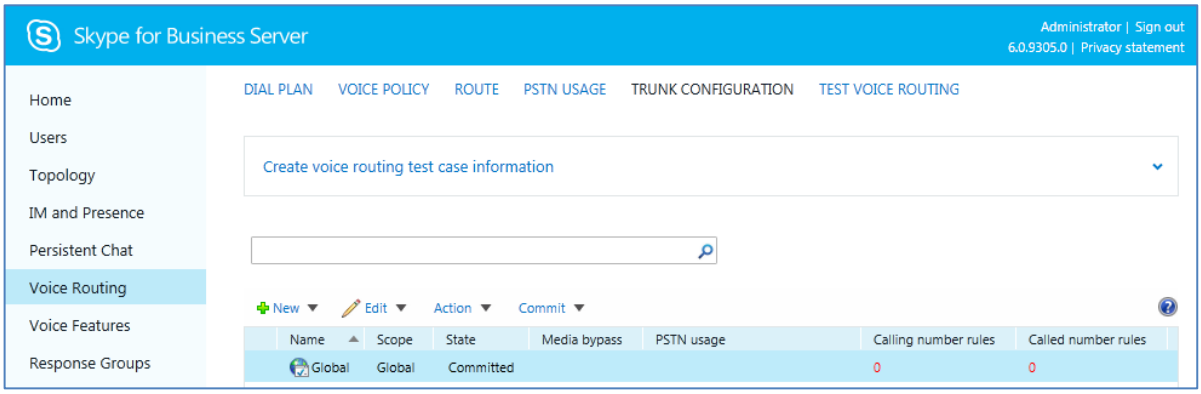


15. For ITSPs that implement a call identifier, continue with the following steps:

Note: The SIP History-Info header provides a method to verify the identity (ID) of the call forwarder (i.e., the Skype for Business user number). This ID is required by 8BVodafone DE "IP Anlagen-Anschluss" SIP Trunk in the P-Asserted-Identity header. The device adds this ID to the P-Asserted-Identity header in the sent INVITE message using the IP Profile (see Section 4.6 on page 44).

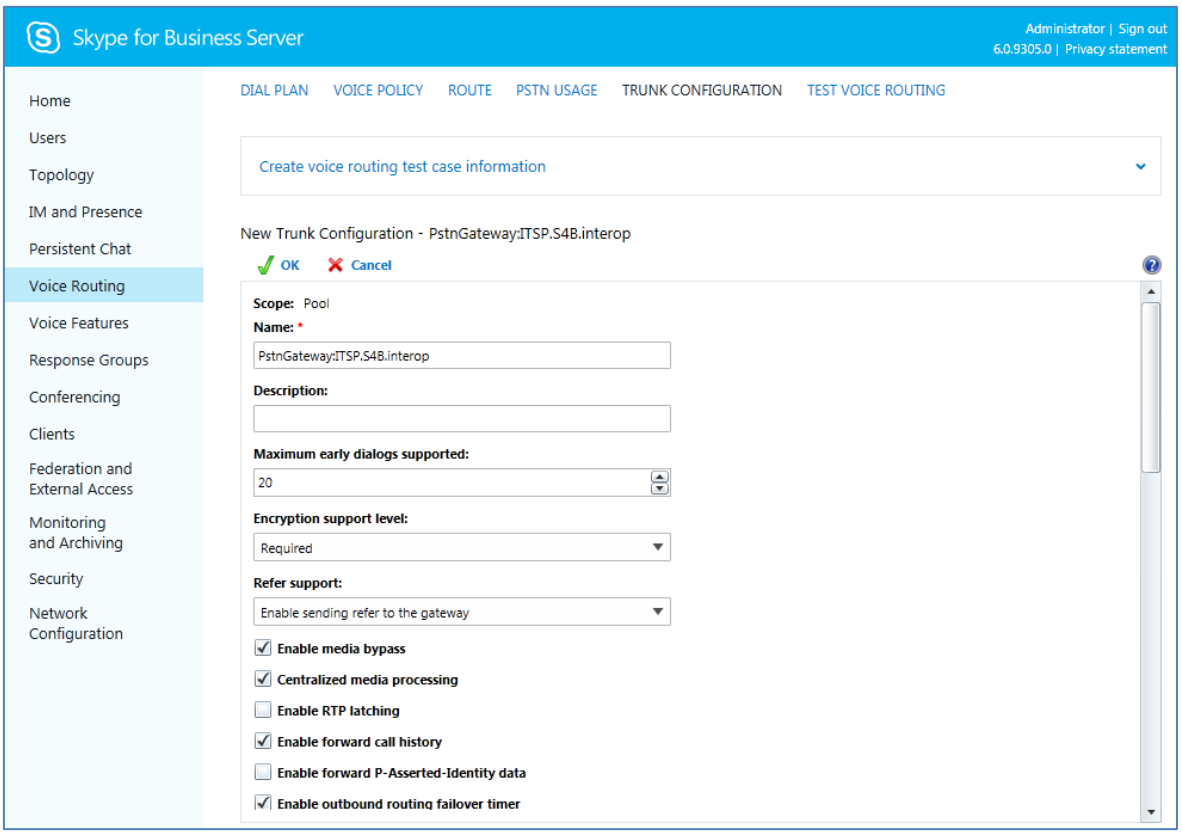
a. In the Voice Routing page, select the **Trunk Configuration** tab. Note that you can add and modify trunk configuration by site or by pool.

Figure 3-28: Voice Routing Screen – Trunk Configuration Tab



b. Click **Edit**; the Edit Trunk Configuration page appears:

Figure 3-29: Voice Routing Screen – Trunk Configuration Tab – Edit



c. Select the **Enable forward call history** check box, and then click **OK**.

d. Repeat Steps 11 through 13 to commit your settings.

16. Use the following command on the Skype for Business Server Management Shell after reconfiguration to verify correct values:

- **Get-CsTrunkConfiguration**

```
Identity                                    :

4 Configuring AudioCodes E-SBC

This chapter provides step-by-step procedures on how to configure AudioCodes E-SBC for interworking between Microsoft Skype for Business Server 2015 and the 8BVodafone DE "IP Anlagen-Anschluss" SIP Trunk. These configuration procedures are based on the interoperability test topology described in Section 2.4 on page 10, and includes the following main areas:

- E-SBC WAN interface - 8BVodafone DE "IP Anlagen-Anschluss" SIP Trunking environment
- E-SBC LAN interface - Skype for Business Server 2015 environment

This configuration is done using the E-SBC's embedded Web server (hereafter, referred to as *Web interface*).

Notes:

- For implementing Microsoft Skype for Business and 8BVodafone DE "IP Anlagen-Anschluss" SIP Trunk based on the configuration described in this section, AudioCodes E-SBC must be installed with a License Key that includes the following software features:
  - √ **Microsoft**
  - √ **SBC**
  - √ **Security**
  - √ **DSP**
  - √ **RTP**
  - √ **SIP**

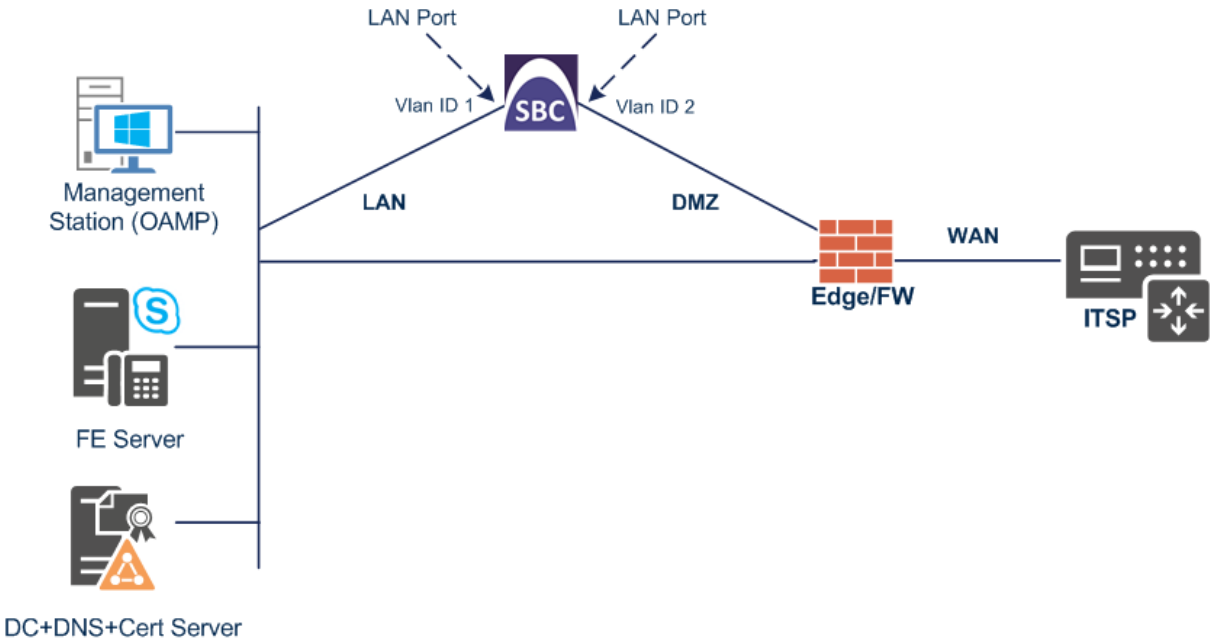
  For more information about the License Key, contact your AudioCodes sales representative.
- The scope of this interoperability test and document does **not** cover all security aspects for connecting the SIP Trunk to the Microsoft Skype for Business environment. Comprehensive security measures should be implemented per your organization's security policies. For security recommendations on AudioCodes' products, refer to the *Recommended Security Guidelines* document.

4.1 Step 1: IP Network Interfaces Configuration

This step describes how to configure the E-SBC's IP network interfaces. There are several ways to deploy the E-SBC; however, this interoperability test topology employs the following deployment method:

- E-SBC interfaces with the following IP entities:
  - Skype for Business servers, located on the LAN
  - 8BVodafone DE "IP Anlagen-Anschluss" SIP Trunk, located on the WAN
- E-SBC connects to the WAN through a DMZ network
- Physical connection: The type of physical connection to the LAN depends on the method used to connect to the Enterprise's network. In the interoperability test topology, E-SBC connects to the LAN and DMZ using dedicated LAN ports (i.e., two ports and two network cables are used).
- E-SBC also uses two logical network interfaces:
  - LAN (VLAN ID 1)
  - DMZ (VLAN ID 2)

Figure 4-1: Network Interfaces in Interoperability Test Topology



4.1.1 Step 1a: Configure VLANs

This step describes how to define VLANs for each of the following interfaces:

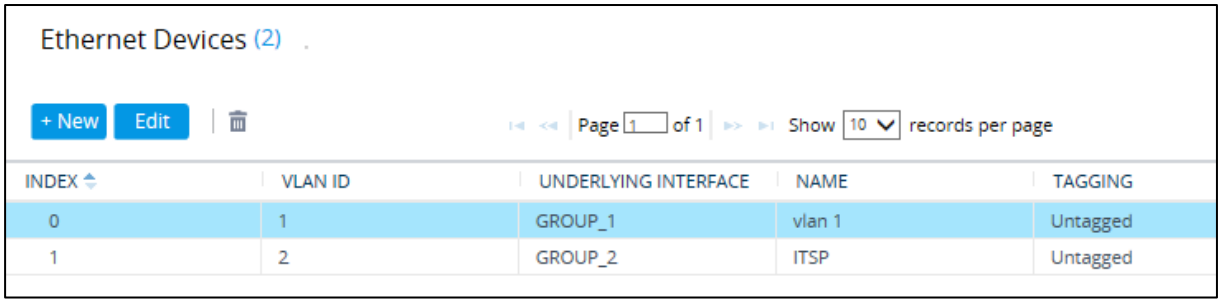
- LAN VoIP (assigned the name "Voice")
- WAN VoIP (assigned the name "ITSP")

➢ **To configure the VLANs:**

1. Open the Ethernet Device table (**Setup** menu > **IP Network** tab > **Core Entities** folder > **Ethernet Devices**).
2. There will be one existing row for VLAN ID 1 and underlying interface GROUP_1.
3. Add another VLAN ID 2 for the WAN side as follows:

Parameter	Value
Index	**1**
VLAN ID	**2**
Underlying Interface	**GROUP_2** (Ethernet port group)
Name	**ITSP**
Tagging	**Untagged**

Figure 4-2: Configured VLAN IDs in Ethernet Device



4.1.2 Step 1b: Configure Network Interfaces

This step describes how to configure the IP network interfaces for each of the following interfaces:

- LAN VoIP (assigned the name "Voice")
- WAN VoIP (assigned the name "ITSP")

➢ **To configure the IP network interfaces:**

1. Open the IP Interfaces table (**Setup** menu > **IP Network** tab > **Core Entities** folder > **IP Interfaces**).
2. Modify the existing LAN network interface:
   a. Select the 'Index' radio button of the **OAMP + Media + Control** table row, and then click **Edit**.

b. Configure the interface as follows:

Parameter	Value
Name	**Voice** (arbitrary descriptive name)
Ethernet Device	**vlan 1**
IP Address	**10.15.40.35** (LAN IP address of E-SBC)
Prefix Length	**16** (subnet mask in bits for 255.255.0.0)
Default Gateway	**10.15.0.1**
Primary DNS	**10.15.27.1**

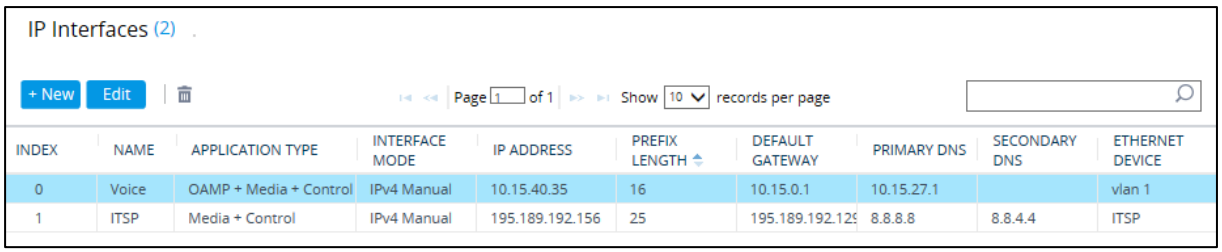
3. Add a network interface for the WAN side:
   a. Click **New**.
   b. Configure the interface as follows:

Parameter	Value
Name	**ITSP**
Application Type	**Media + Control**
Ethernet Device	**ITSP**
IP Address	**195.189.192.156** (DMZ IP address of E-SBC)
Prefix Length	**25** (subnet mask in bits for 255.255.255.128)
Default Gateway	**195.189.192.129** (router's IP address)
Primary DNS	**8.8.8.8**
Secondary DNS	**8.8.4.4**

4. Click **Apply**.

The configured IP network interfaces are shown below:

Figure 4-3: Configured Network Interfaces in IP Interfaces Table



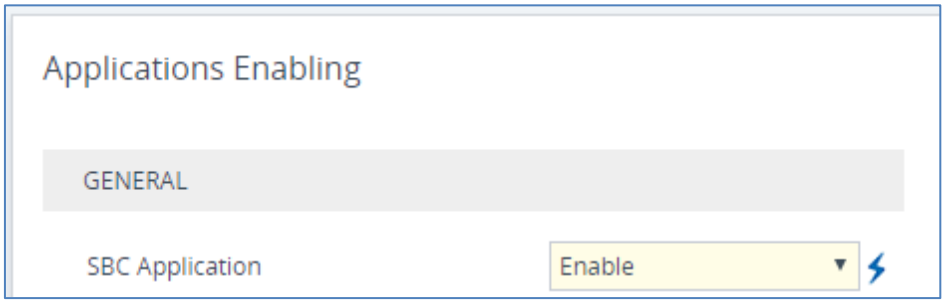
4.2 Step 2: Enable the SBC Application

This step describes how to enable the SBC application.

➢ **To enable the SBC application:**

1. Open the Applications Enabling page (**Setup** menu > **Signaling & Media** tab > **Core Entities** folder > **Applications Enabling**).

Figure 4-4: Enabling SBC Application



2. From the 'SBC Application' drop-down list, select **Enable**.
3. Click **Apply**.
4. Reset the E-SBC with a burn to flash for this setting to take effect (see Section 4.16 on page 78).

4.3 Step 3: Configure Media Realms

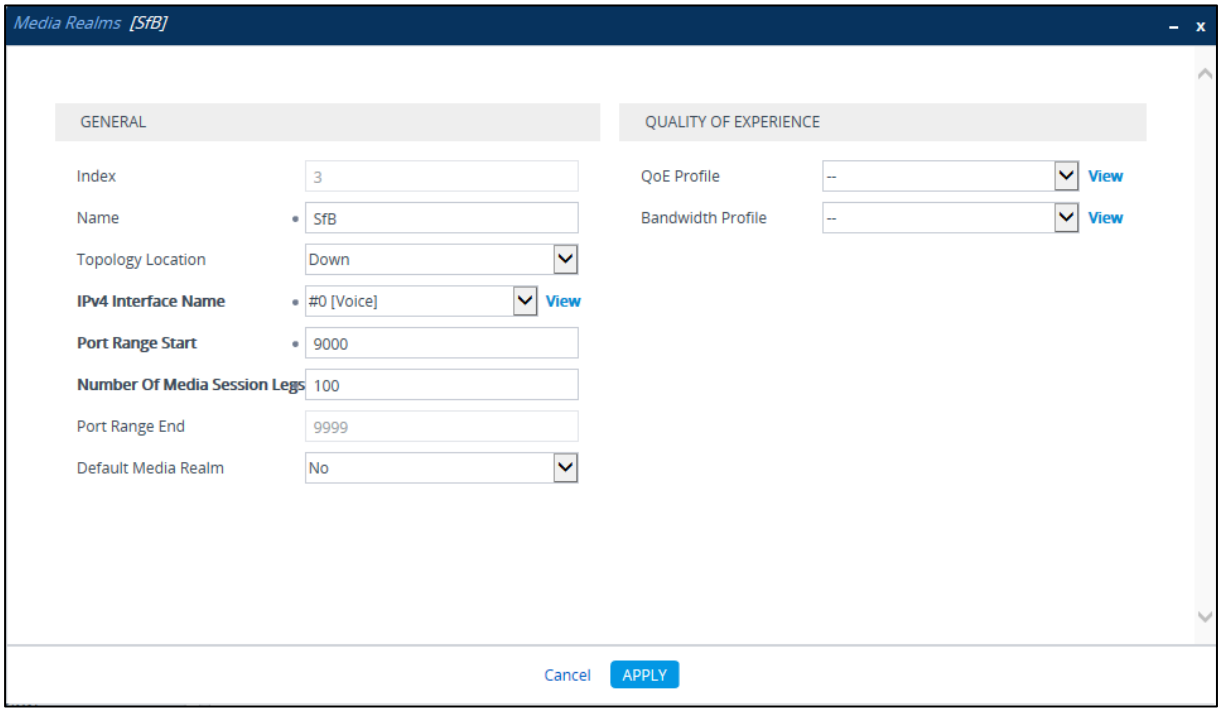
This step describes how to configure Media Realms. The simplest configuration is to create two Media Realms - one for internal (LAN) traffic and one for external (WAN) traffic.

➢ **To configure Media Realms:**

1. Open the Media Realms table (**Setup** menu > **Signaling & Media** tab > **Core Entities** folder > **Media Realms**).
2. Add a Media Realm for the LAN interface. You can use the default Media Realm (Index 0), but modify it as shown below:

Parameter	Value
Index	**3**
Name	**Skype for Business** (descriptive name)
IPv4 Interface Name	**#0 [Voice]**
Port Range Start	**9000** (represents lowest UDP port number used for media on LAN)
Number of Media Session Legs	**100** (media sessions assigned with port range)

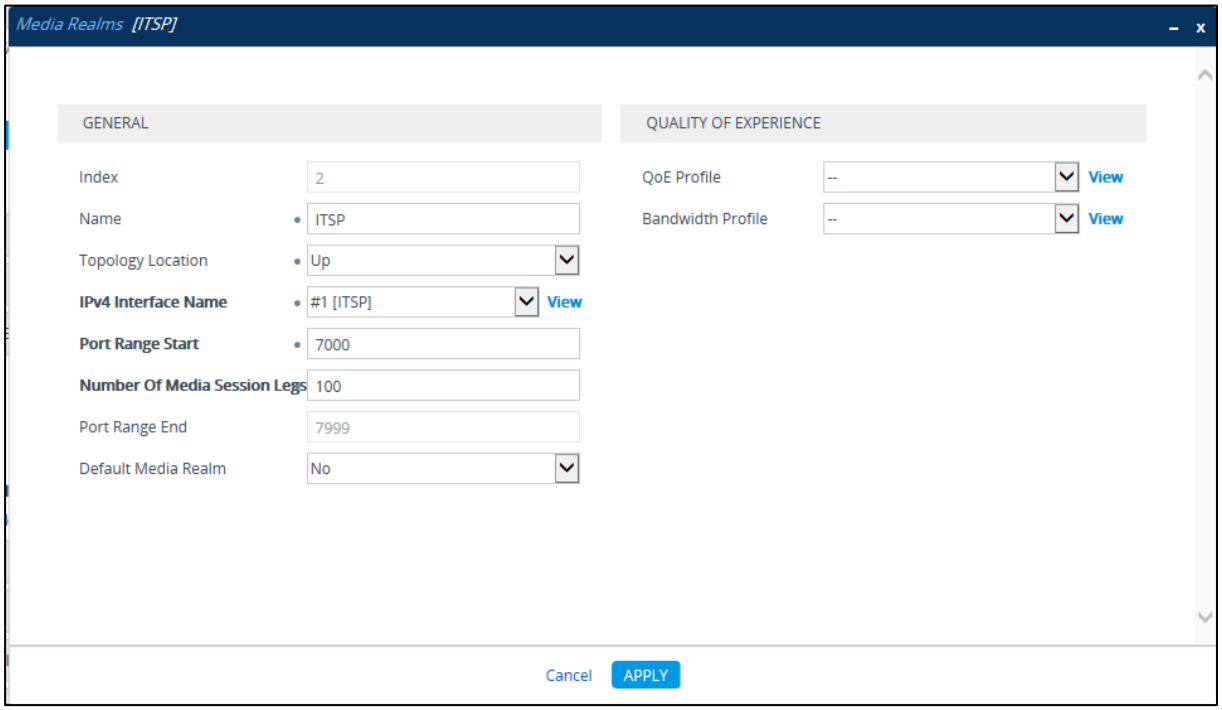
Figure 4-5: Configuring Media Realm for LAN



3. Configure a Media Realm for WAN traffic:

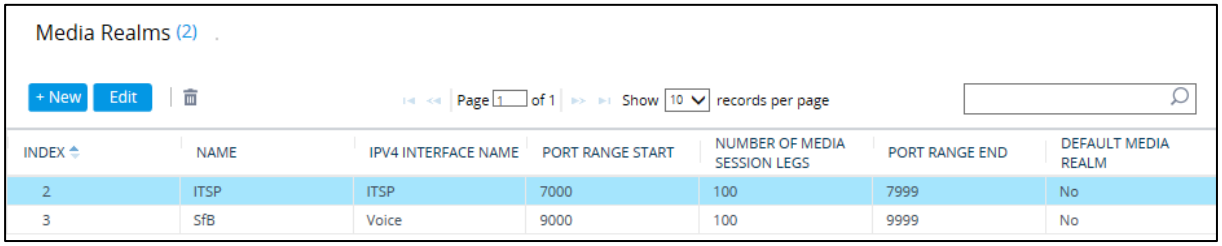
Parameter	Value
Index	**2**
Name	**ITSP** (arbitrary name)
Topology Location	**Up**
IPv4 Interface Name	**#1 [ITSP]**
Port Range Start	**7000** (represents lowest UDP port number used for media on WAN)
Number of Media Session Legs	**100** (media sessions assigned with port range)

Figure 4-6: Configuring Media Realm for WAN



The configured Media Realms are shown in the figure below:

Figure 4-7: Configured Media Realms in Media Realm Table



4.4 Step 4: Configure SIP Signaling Interfaces

This step describes how to configure SIP Interfaces. For the interoperability test topology, an internal and external SIP Interface must be configured for the E-SBC.

➢ **To configure SIP Interfaces:**

1. Open the SIP Interfaces table (**Setup** menu > **Signaling & Media** tab > **Core Entities** folder > **SIP Interfaces**).
2. Add a SIP Interface for the LAN interface. You can use the default SIP Interface (Index 0), but modify it as shown below:

Parameter	Value
Index	**0**
Name	**SfB** (see note at the end of this section)
Network Interface	**#0 [Voice]**
Application Type	**SBC**
UDP Port (for supporting Fax ATA device)	**0** (change if required)
TCP	**0**
TLS Port	**5067** (see note below)
Media Realm	**#3 [SfB]**

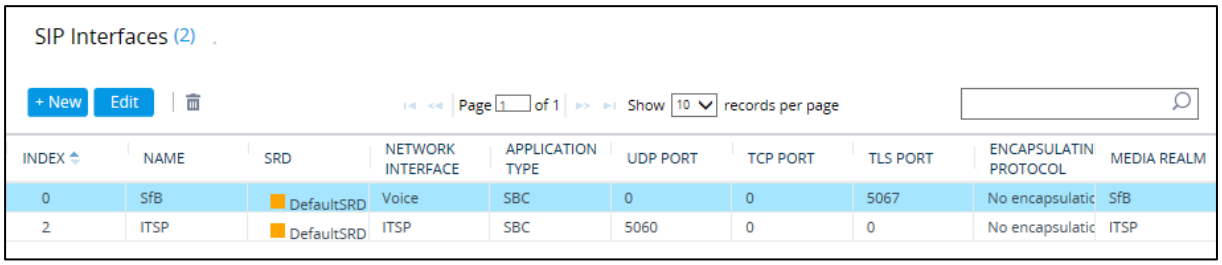
Note: The TLS port parameter must be identically configured in the Skype for Business Topology Builder (see Section 3.1 on page 13).

3. Configure a SIP Interface for the WAN:

Parameter	Value
Index	**2**
Name	**ITSP**
Network Interface	**#1 [ITSP]**
Topology Location	**Up**
Application Type	**SBC**
UDP Port	**5060**
TCP and TLS	**0**
Media Realm	**#2 [ITSP]**

The configured SIP Interfaces are shown in the figure below:

Figure 4-8: Configured SIP Interfaces in SIP Interface Table



Note: Current software releases uses the string **names** of the configuration entities (e.g., SIP Interface, Proxy Sets, and IP Groups). Therefore, it is recommended to configure each configuration entity with meaningful names for easy identification.

4.5 Step 5: Configure Proxy Sets

This step describes how to configure Proxy Sets. The Proxy Set defines the destination address (IP address or FQDN) of the IP entity server. Proxy Sets can also be used to configure load balancing between multiple servers.

For the interoperability test topology, two Proxy Sets need to be configured for the following IP entities:

- Microsoft Skype for Business Server 2015
- 8BVodafone DE "IP Anlagen-Anschluss" SIP Trunk

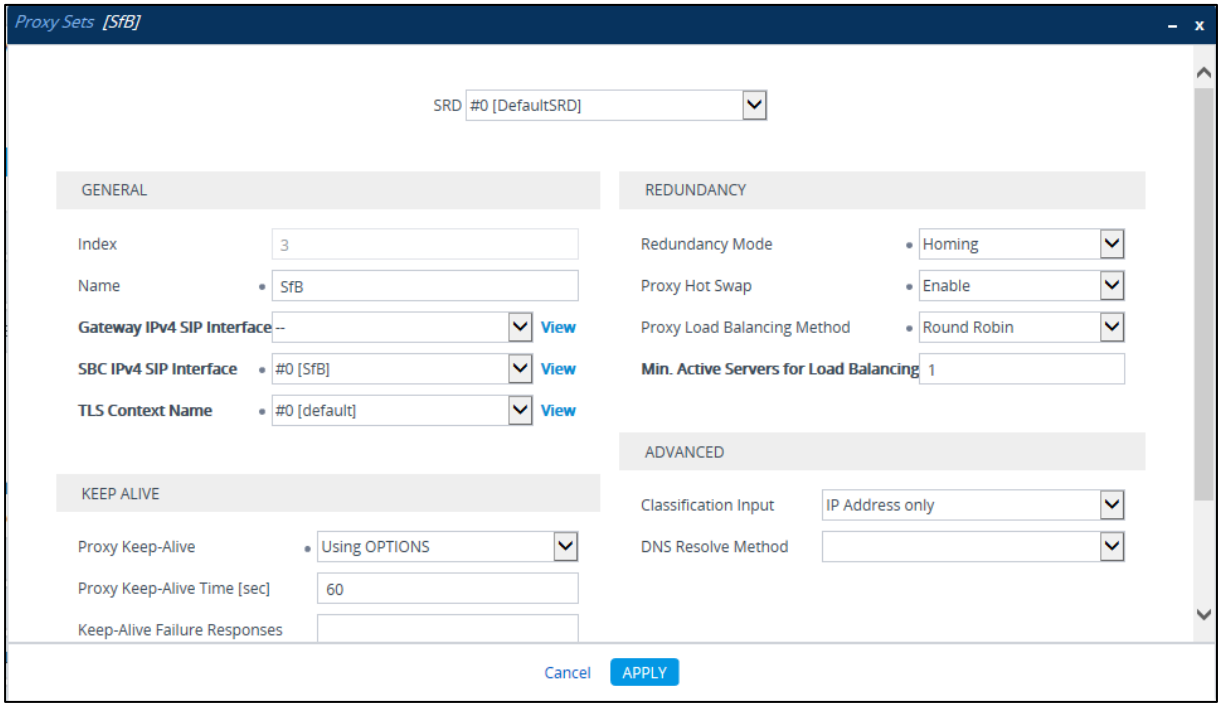
The Proxy Sets will be later applying to the VoIP network by assigning them to IP Groups.

➢ **To configure Proxy Sets:**

1. Open the Proxy Sets table (**Setup** menu > **Signaling & Media** tab > **Core Entities** folder >**Proxy Sets**).
2. Add a Proxy Set for the Skype for Business Server 2015 as shown below:

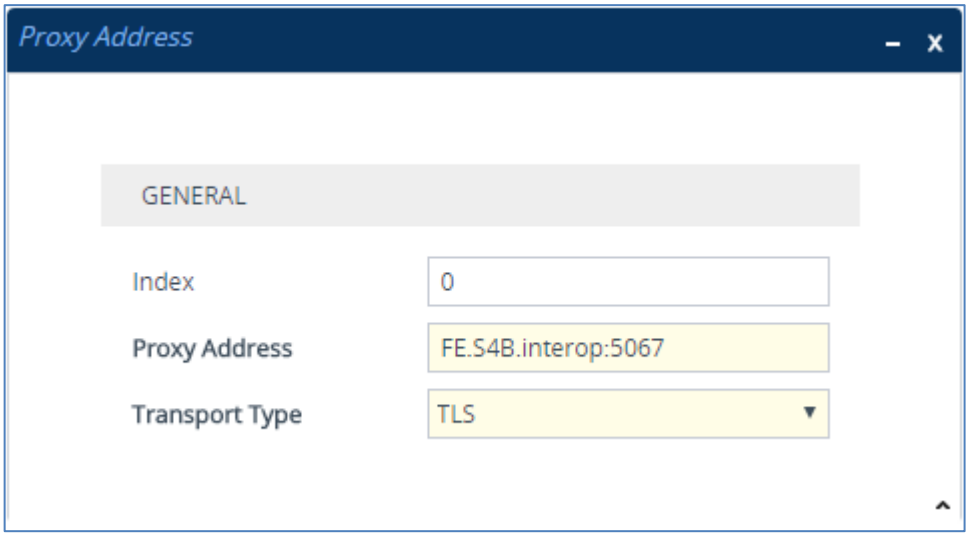
Parameter	Value
Index	**3**
Name	**SfB**
SBC IPv4 SIP Interface	**#0 [SfB]**
Proxy Keep-Alive	**Using Options**
Redundancy Mode	**Homing**
Proxy Hot Swap	**Enable**
Proxy Load Balancing Method	**Round Robin**

Figure 4-9: Configuring Proxy Set for Microsoft Skype for Business Server 2015



a. Select the index row of the Proxy Set that you added, and then click the **Proxy Address** link located below the table; the Proxy Address table opens.
b. Click **New**; the following dialog box appears:

Figure 4-10: Configuring Proxy Address for Microsoft Skype for Business Server 2015



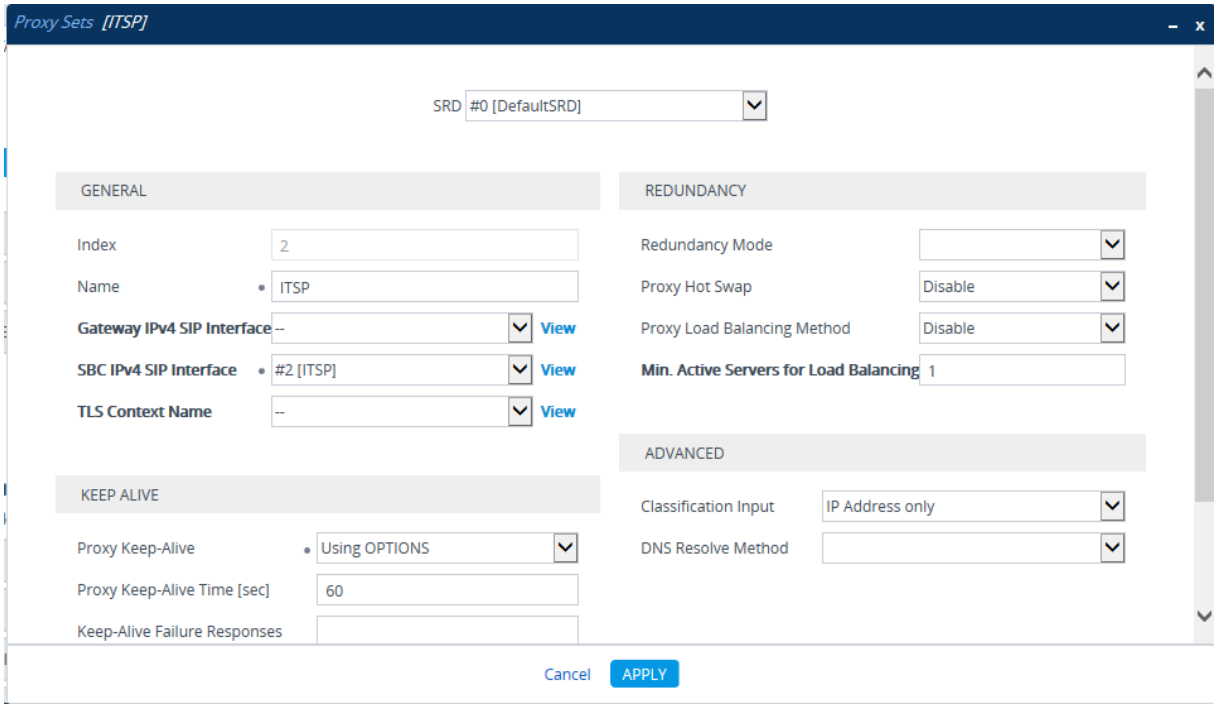
c. Configure the address of the Proxy Set according to the parameters described in the table below.
d. Click **Apply**.

Parameter	Value
Index	**0**
Proxy Address	**FE.S4B.interop:5067** (Skype for Business Server 2015 IP address / FQDN and destination port)
Transport Type	**TLS**

3. Configure a Proxy Set for the 8BVodafone DE "IP Anlagen-Anschluss" SIP Trunk:

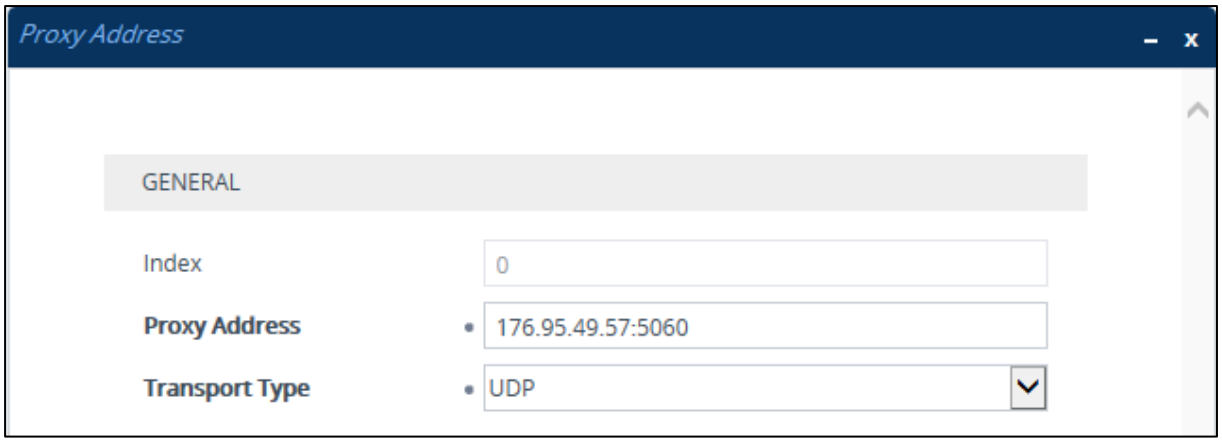
Parameter	Value
Index	**2**
Name	**ITSP**
SBC IPv4 SIP Interface	**#2 [ITSP]**
Proxy Keep-Alive	**Using Options**

Figure 4-11: Configuring Proxy Set for 8BVodafone DE "IP Anlagen-Anschluss" SIP Trunk



a. Select the index row of the Proxy Set that you added, and then click the **Proxy Address** link located below the table; the Proxy Address table opens.
b. Click **New**; the following dialog box appears:

Figure 4-12: Configuring Proxy Address for 8BVodafone DE "IP Anlagen-Anschluss" SIP Trunk

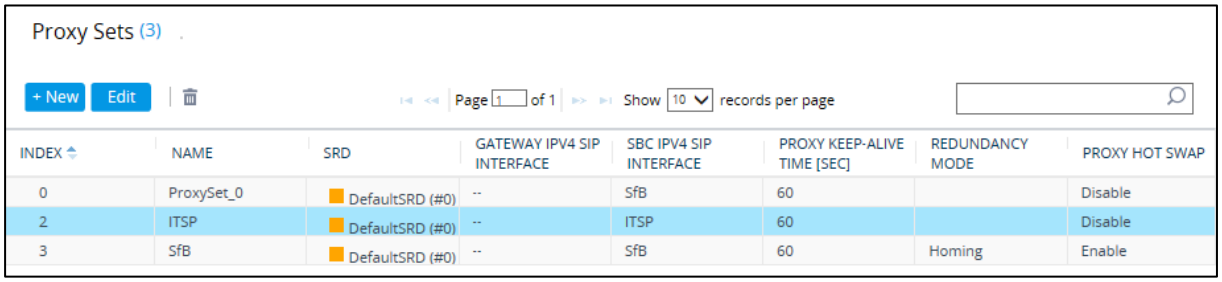


c. Configure the address of the Proxy Set according to the parameters described in the table below.
d. Click **Apply**.

Parameter	Value
Index	**0**
Proxy Address	**176.95.49.57:5060** (IP address / FQDN and destination port)
Transport Type	**UDP**

The configured Proxy Sets are shown in the figure below:

Figure 4-13: Configured Proxy Sets in Proxy Sets Table



INDEX	NAME	SRD	GATEWAY IPV4 SIP INTERFACE	SBC IPV4 SIP INTERFACE	PROXY KEEP-ALIVE TIME [SEC]	REDUNDANCY MODE	PROXY HOT SWAP
0	ProxySet_0	DefaultSRD (#0)	--	SfB	60		Disable
2	ITSP	DefaultSRD (#0)	--	ITSP	60		Disable
3	SfB	DefaultSRD (#0)	--	SfB	60	Homing	Enable

4.6 Step 6: Configure Coders

This step describes how to configure coders (termed *Coder Group*). As Skype for Business Server 2015 supports the G.711 coder while the network connection to 8BVodafone DE "IP Anlagen-Anschluss" SIP Trunk may restrict operation with a lower bandwidth coder such as G.729, you need to add a Coder Group with the G.729 coder for the 8BVodafone DE "IP Anlagen-Anschluss" SIP Trunk.

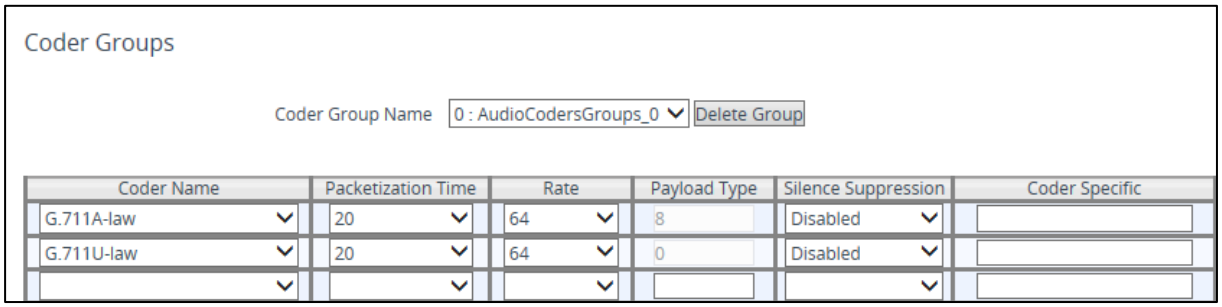
Note that the Coder Group ID for this entity will be assign to its corresponding IP Profile in the next step.

➢ **To configure coders:**

1. Open the Coder Groups table (**Setup** menu > **Signaling & Media** tab > **Coders & Profiles** folder > **Coder Groups**).
2. Configure a Coder Group for Skype for Business Server 2015:

Parameter	Value
Coder Group Name	**AudioCodersGroups_0**
Coder Name	▪ **G.711 A-law** ▪ **G.711 U-law**
Silence Suppression	**Disabled** (for both coders)

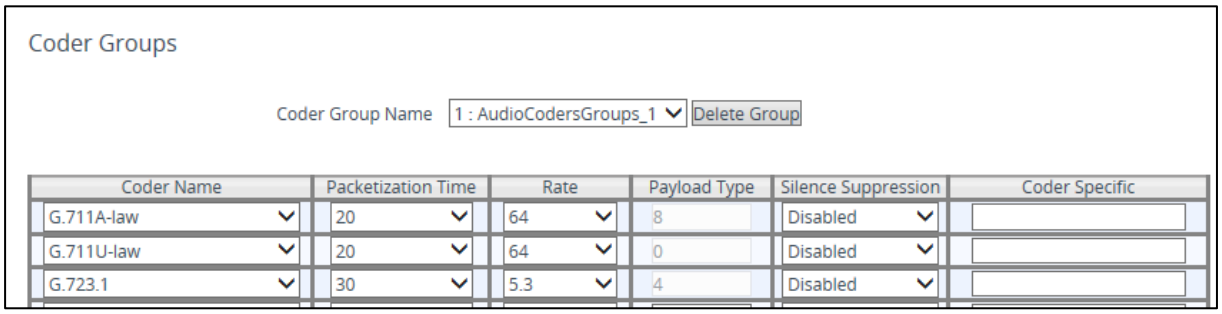
Figure 4-14: Configuring Coder Group for Skype for Business Server 2015



3. Configure a Coder Group for 8BVodafone DE "IP Anlagen-Anschluss" SIP Trunk:

Parameter	Value
Coder Group Name	**AudioCodersGroups_1**
Coder Name	**G.711 A-law** **G.711 U-law** **G.723.1**

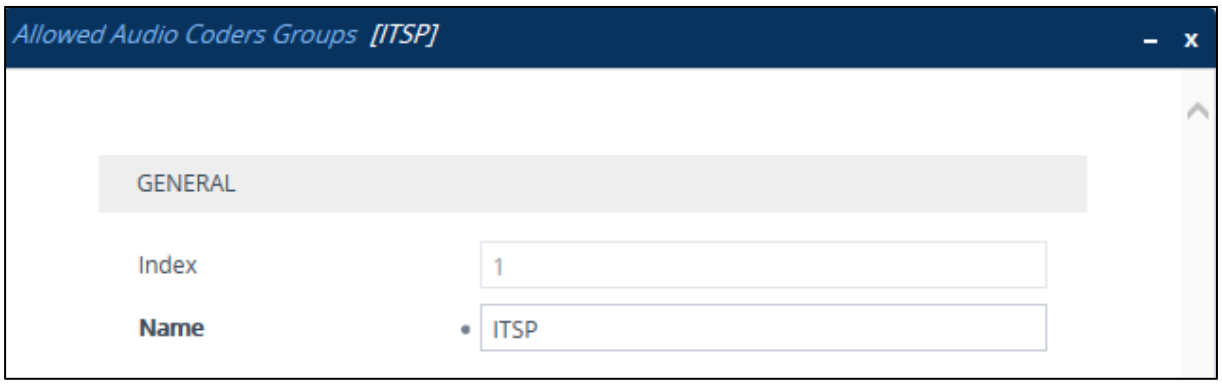
Figure 4-15: Configuring Coder Group for 8BVodafone DE "IP Anlagen-Anschluss" SIP Trunk



➢ **To set a preferred coder for the 8BVodafone DE "IP Anlagen-Anschluss" SIP Trunk:**

1. Open the Allowed Audio Coders Groups table (**Setup** menu > **Signaling & Media** tab > **Coders & Profiles** folder > **Allowed Audio Coders Groups**).
2. Click **New** and configure a name for the Allowed Audio Coders Group for 8BVodafone DE "IP Anlagen-Anschluss" SIP Trunk.

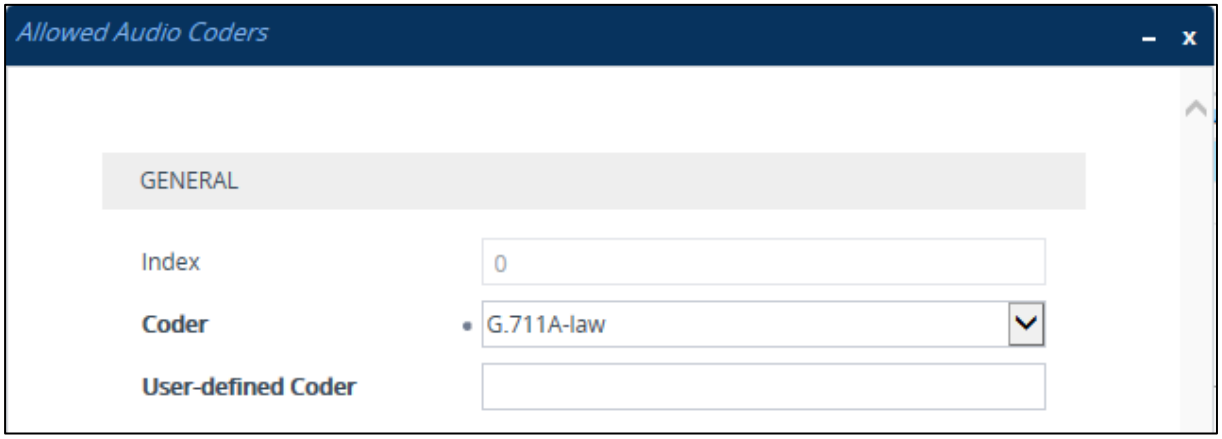
Figure 4-16: Configuring Allowed Coders Group for 8BVodafone DE "IP Anlagen-Anschluss" SIP Trunk



3. Click **Apply.**
4. Select the new row that you configured, and then click the **Allowed Audio Coders** link located below the table; the Allowed Audio Coders table opens.
5. Click **New** and configure an Allowed Coders as follows:

Parameter	Value
Index	**0**
Coder	**G.711 A-law**

Figure 4-17: Configuring Allowed Coders for 8BVodafone DE "IP Anlagen-Anschluss" SIP Trunk



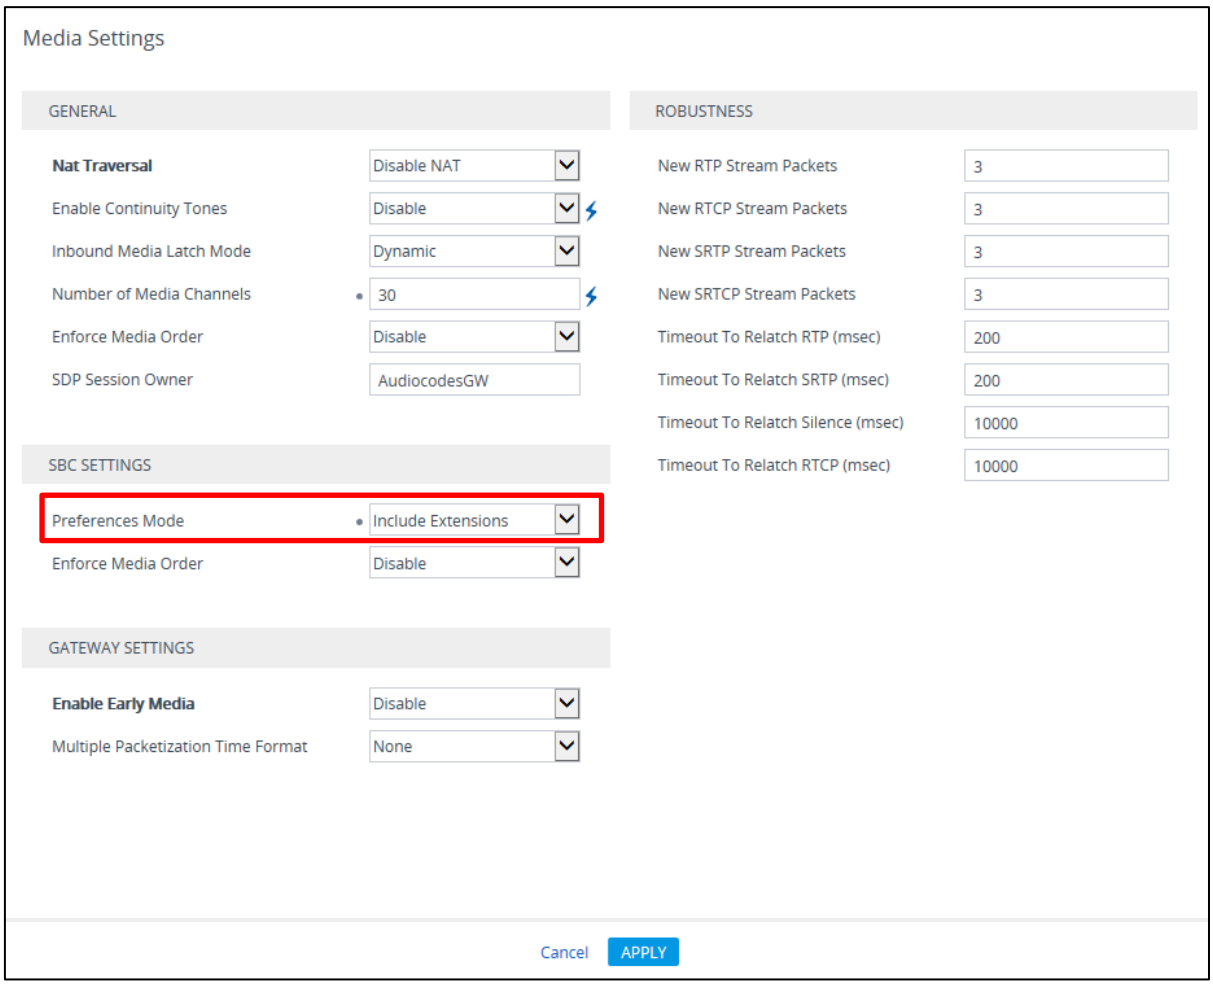
6. Click **New** and configure Allowed Audio Coders as follows:

Parameter	Value
Index	**1**
Coder	**G.711 U-law**

Figure 4-18: Configuring Allowed Coders for 8BVodafone DE "IP Anlagen-Anschluss" SIP Trunk

7. Open the Media Settings page (**Setup** menu > **Signaling & Media** tab > **Media** folder > **Media Settings**).

Figure 4-19: SBC Preferences Mode



8. Change the 'Preferences Mode' parameter to **Include Extensions**.
9. Click **Apply**.

4.7 Step 7: Configure IP Profiles

This step describes how to configure IP Profiles. The IP Profile defines a set of call capabilities relating to signaling (e.g., SIP message terminations such as REFER) and media (e.g., coder and transcoding method).

In this interoperability test topology, IP Profiles need to be configured for the following IP entities:

- Microsoft Skype for Business Server 2015 – to operate in secure mode using SRTP and SIP over TLS
- 8BVodafone DE "IP Anlagen-Anschluss" SIP trunk – to operate in non-secure mode using RTP and SIP over UDP

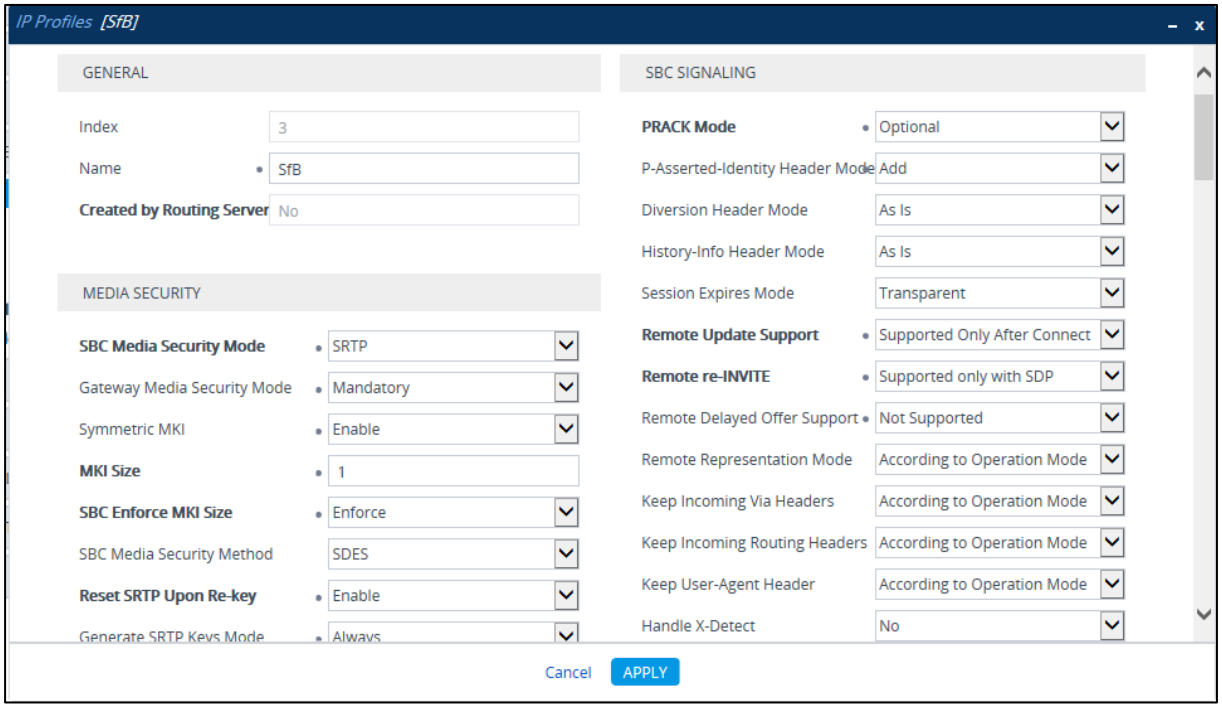
➢ **To configure IP Profile for the Skype for Business Server 2015:**

1. Open the IP Profiles table (**Setup** menu > **Signaling & Media** tab > **Coders & Profiles** folder > **IP Profiles**).
2. Click **New**, and then configure the parameters as follows:

Parameter	Value
General	
Index	**3**
Name	**SfB**
Media Security	
SBC Media Security Mode	**SRTP**
Gateway Media Security	**Mandatory**
Symmetric MKI	**Enable**
MKI Size	**1**
SBC Enforce MKI Size	**Enforce**
Reset SRTP State Upon Re-key	**Enable**
Generate SRTP Keys Mode:	**Always**
SBC Early Media	
Remote Early Media RTP Detection Mode	**By Media** (required, as Skype for Business Server 2015 does not send RTP immediately to the remote side when it sends a SIP 18x response)
SBC Media	
Allow Audio Coders	**#0 [SfB]**
RFC 2833 Mode	**Extend**
RFC 2833 DTMF Payload Type	**101**
RTCP Mode	**Generate Always**
SBC Signaling	
PRACK Mode	**Optional**
Remote Update Support	**Supported Only After Connect**
Remote re-INVITE Support	**Supported Only with SDP**

Parameter	Value
Remote Delayed Offer Support	**Not Supported**
SBC Forward and Transfer	
Remote REFER Mode	**Handle Locally** (required, as Skype for Business Server 2015 does not support receipt of SIP REFER)
Play RBT To Transferee	**Yes**
Remote 3xx Mode	**Handle Locally** (required, as Skype for Business Server 2015 does not support receipt of SIP 3xx responses)
Broken Connection Mode	**Ignore**

Figure 4-20: Configuring IP Profile for Skype for Business Server 2015



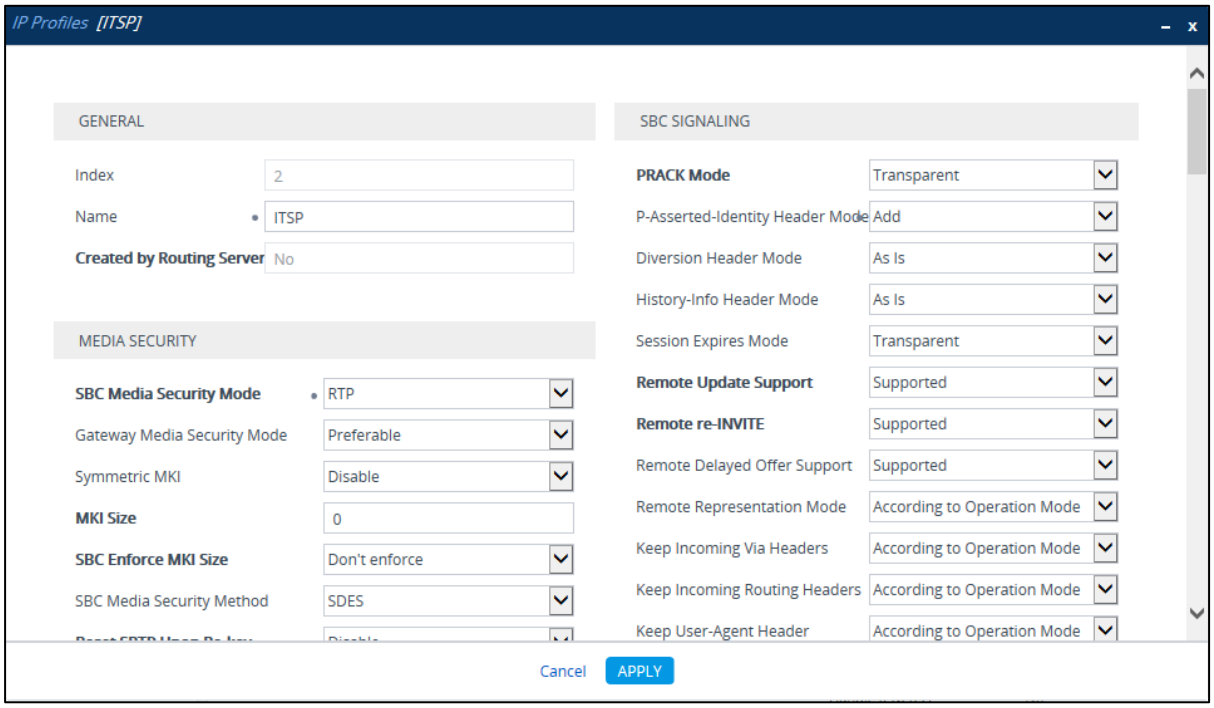
3. Click **Apply**.

➢ **To configure an IP Profile for the 8BVodafone DE "IP Anlagen-Anschluss" SIP Trunk:**

1. Click **New**, and then configure the parameters as follows:

Parameter	Value
General	
Index	**2**
Name	**ITSP**
Media Security	
SBC Media Security Mode	**RTP**
SBC Early Media	
Remote Early Media	Not supported
Generate RTP	**Until RTP detected**
SBC Media	
Allowed Audio Coders	**#1 [ITSP]**
Allowed Coders Mode	**Restriction** (lists Allowed Coders first and then original coders in the received SDP offer)
RTP Redundancy Mode	**Disable**
SBC Signaling	
P-Asserted-Identity Header Mode	**Add**
SBC Forward and Transfer	
Remote REFER Mode	**Handle Locally** (required, as Skype for Business Server 2015 does not support receipt of SIP REFER**)**
Broken Connection Mode	**Ignore**

Figure 4-21: Configuring IP Profile for 8BVodafone DE "IP Anlagen-Anschluss" SIP Trunk



2. Click **Apply**.

4.8 Step 8: Configure IP Groups

This step describes how to configure IP Groups. The IP Group represents an IP entity on the network with which the E-SBC communicates. This can be a server (e.g., IP PBX or ITSP) or it can be a group of users (e.g., LAN IP phones). For servers, the IP Group is typically used to define the server's IP address by associating it with a Proxy Set. Once IP Groups are configured, they are used to configure IP-to-IP routing rules for denoting source and destination of the call.

In this interoperability test topology, IP Groups must be configured for the following IP entities:

- Skype for Business Server 2015 (Mediation Server) located on LAN
- 8BVodafone DE "IP Anlagen-Anschluss" SIP Trunk located on WAN

➢ **To configure IP Groups:**

1. Open the IP Groups table (**Setup** menu > **Signaling & Media** tab > **Core Entities** folder > **IP Groups**).
2. Add an IP Group for the Skype for Business Server 2015:

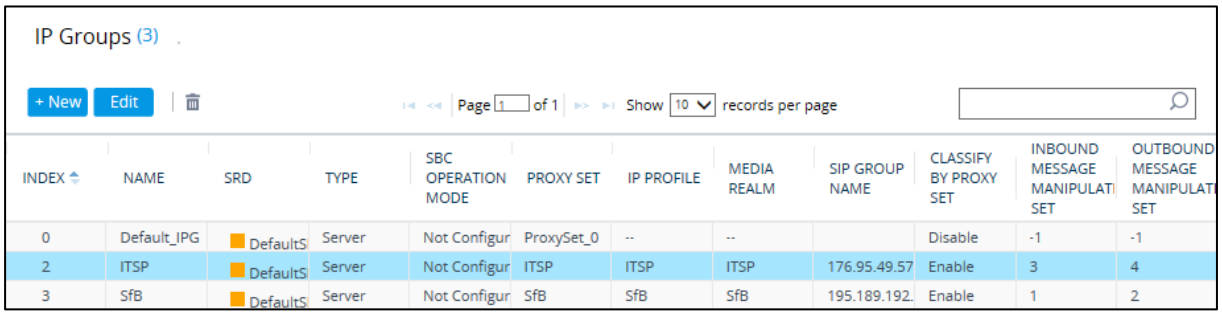
Parameter	Value
Index	**3**
Name	**SfB**
Type	**Server**
Proxy Set	**#3 [SfB]**
IP Profile	**#3 [SfB]**
Media Realm	**#3 [SfB]**
SIP Group Name	**195.189.192.156** (according to ITSP requirement)

3. Configure an IP Group for the 8BVodafone DE "IP Anlagen-Anschluss" SIP Trunk:

Parameter	Value
Index	**2**
Name	**ITSP**
Topology Location	**Up**
Type	**Server**
Proxy Set	**#2 [ITSP]**
IP Profile	**#2 [ITSP]**
Media Realm	**#2 [ITSP]**
SIP Group Name	**176.95.49.57** (according to ITSP requirement)

The configured IP Groups are shown in the figure below:

Figure 4-22: Configured IP Groups in IP Group Table



4.9 Step 9: SIP TLS Connection Configuration

This section describes how to configure the E-SBC for using a TLS connection with the Skype for Business Server 2015 Mediation Server. This is essential for a secure SIP TLS connection.

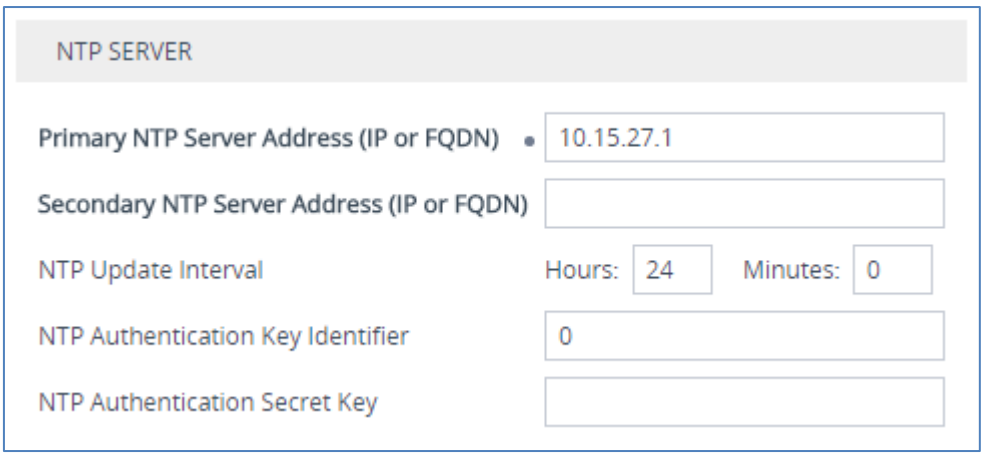
4.9.1 Step 9a: Configure the NTP Server Address

This step describes how to configure the NTP server's IP address. It is recommended to implement an NTP server (Microsoft NTP server or a third-party server) to ensure that the E-SBC receives the accurate and current date and time. This is necessary for validating certificates of remote parties.

➢ **To configure the NTP server address:**

1. Open the Time & Date page (**Setup** menu > **Administration** tab > **Time & Date**).
2. In the 'Primary NTP Server Address' field, enter the IP address of the NTP server (e.g., **10.15.27.1**).

Figure 4-23: Configuring NTP Server Address



3. Click **Apply**.

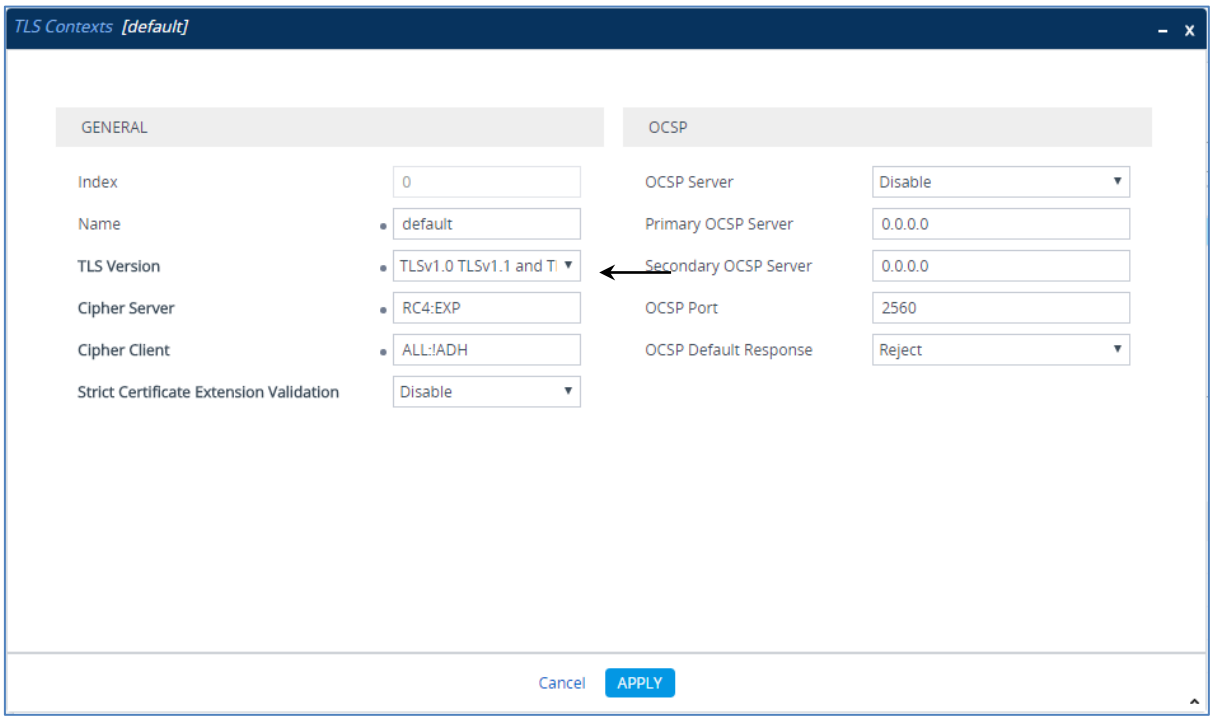
4.9.2 Step 9b: Configure the TLS version

This step describes how to configure the E-SBC to use TLS only. AudioCodes recommends implementing only TLS to avoid flaws in SSL.

➢ **To configure the TLS version:**

1. Open the TLS Contexts table (**Setup** menu > **IP Network** tab > **Security** folder > **TLS Contexts**).
2. In the TLS Contexts table, select the required TLS Context index row (usually default index 0 will be used), and then click '**Edit**'.
3. From the '**TLS Version**' drop-down list, select '**TLSv1.0 TLSv1.1 and TLSv1.2**'

Figure 4-24: Configuring TLS Version



4. Click **Apply**.

4.9.3 Step 9c: Configure a Certificate

This step describes how to exchange a certificate with Microsoft Certificate Authority (CA). The certificate is used by the E-SBC to authenticate the connection with Skype for Business Server 2015.

The procedure involves the following main steps:

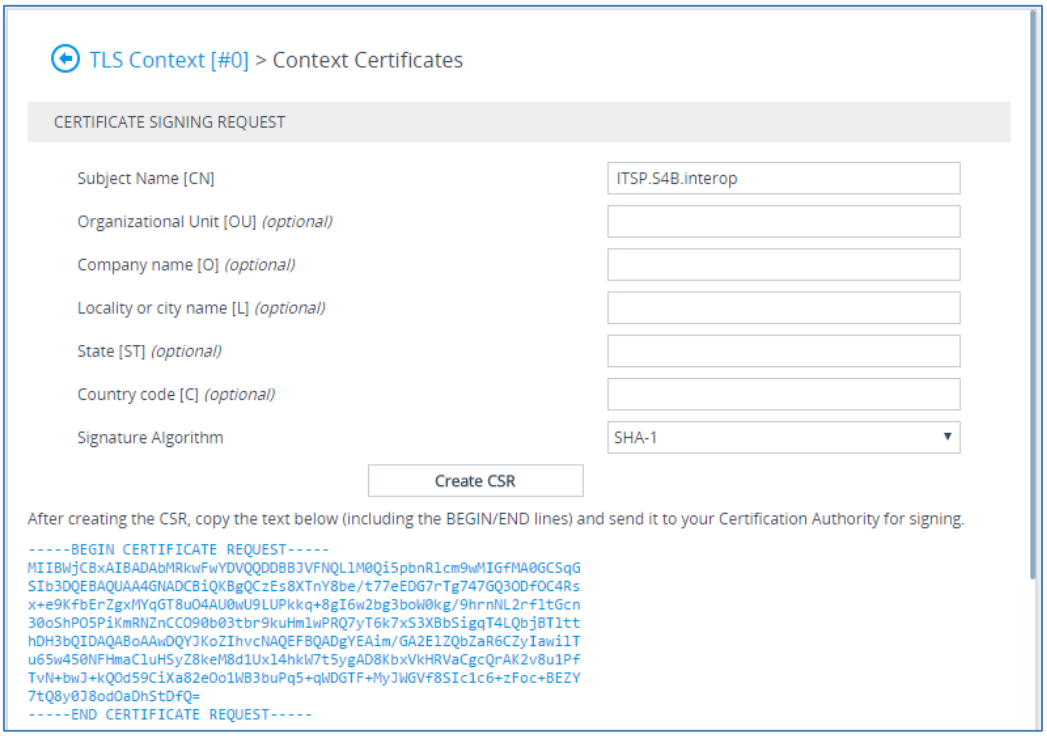
a. Generating a Certificate Signing Request (CSR).
b. Requesting Device Certificate from CA.
c. Obtaining Trusted Root Certificate from CA.
d. Deploying Device and Trusted Root Certificates on E-SBC.

Note: The Subject Name (CN) field parameter should be identically configured in the DNS Active Directory and Topology Builder (see Section 3.1 on page 13).

➢ **To configure a certificate:**

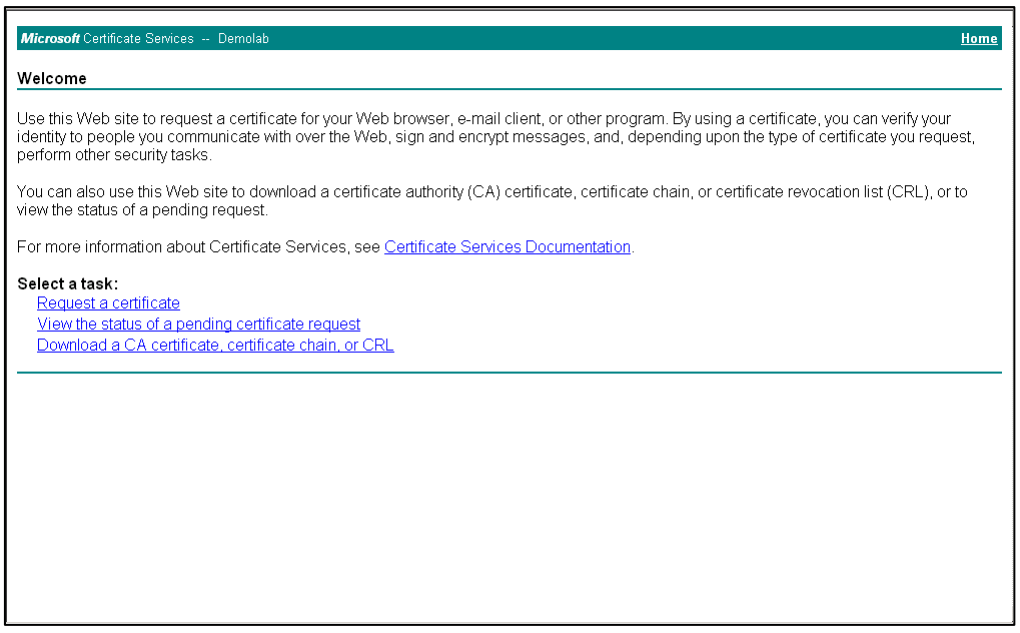
1. Open the TLS Contexts page (**Setup** menu > **IP Network** tab > **Security** folder > **TLS Contexts**).
2. In the TLS Contexts page, select the required TLS Context index row, and then click the **Change Certificate** link located below the table; the Context Certificates page appears.
3. Under the **Certificate Signing Request** group, do the following:
   a. In the 'Subject Name [CN]' field, enter the E-SBC FQDN name (e.g., **VodaSBC.S4B.interop**).
   b. Fill in the rest of the request fields according to your security provider's instructions.
   c. Click the **Create CSR** button; a textual certificate signing request is displayed in the area below the button:

Figure 4-25: Certificate Signing Request – Creating CSR



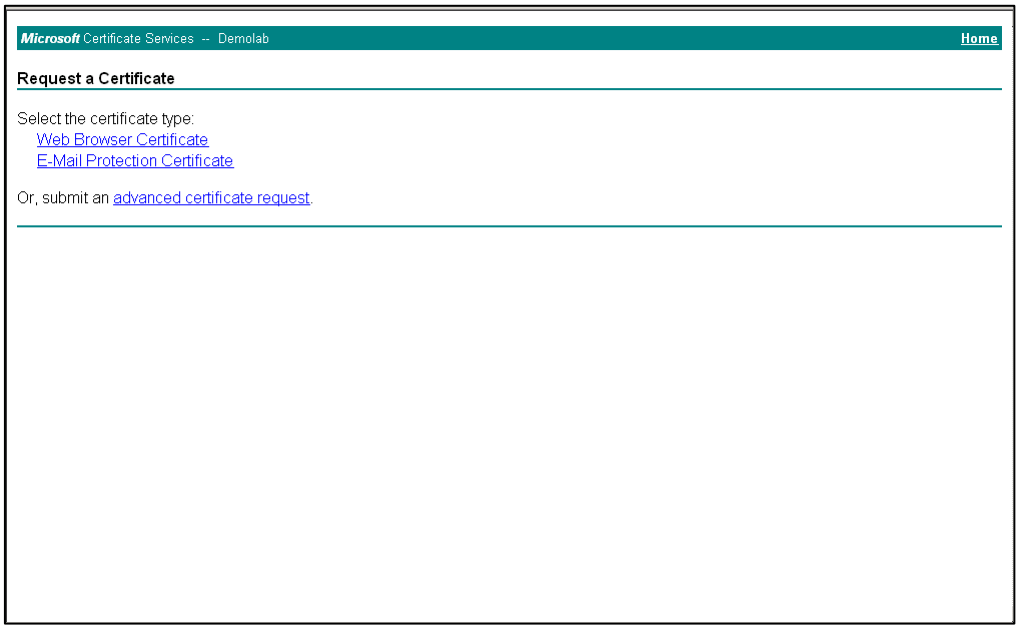
4. Copy the CSR from the line **"----BEGIN CERTIFICATE" to "END CERTIFICATE REQUEST----"** to a text file (such as Notepad), and then save it to a folder on your computer with the file name, *certreq.txt*.
5. Open a Web browser and navigate to the Microsoft Certificates Services Web site at http://<certificate server>/CertSrv.

Figure 4-26: Microsoft Certificate Services Web Page



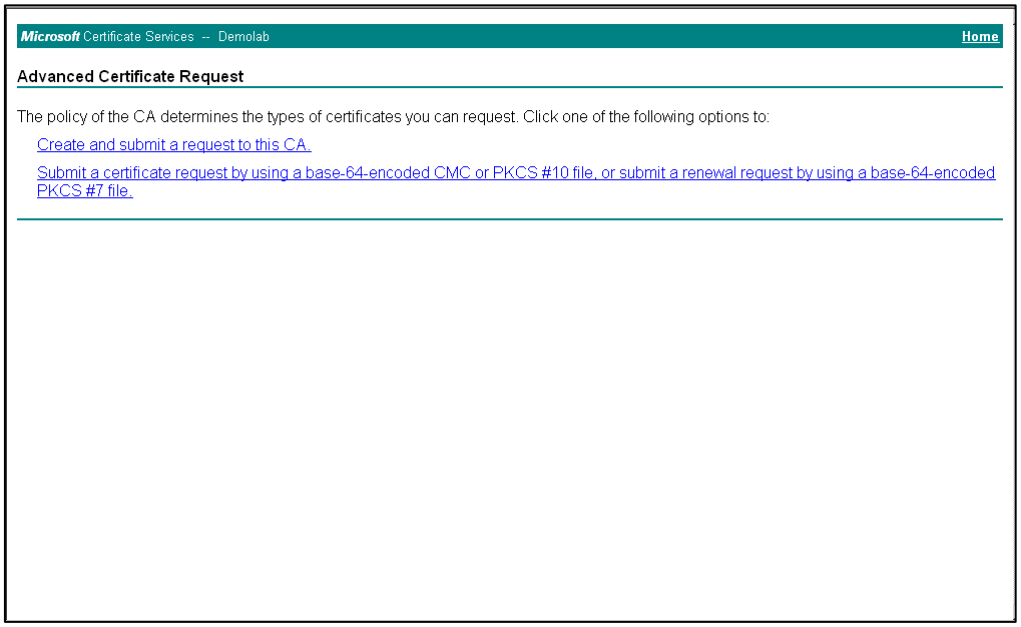
6. Click **Request a certificate**.

Figure 4-27: Request a Certificate Page



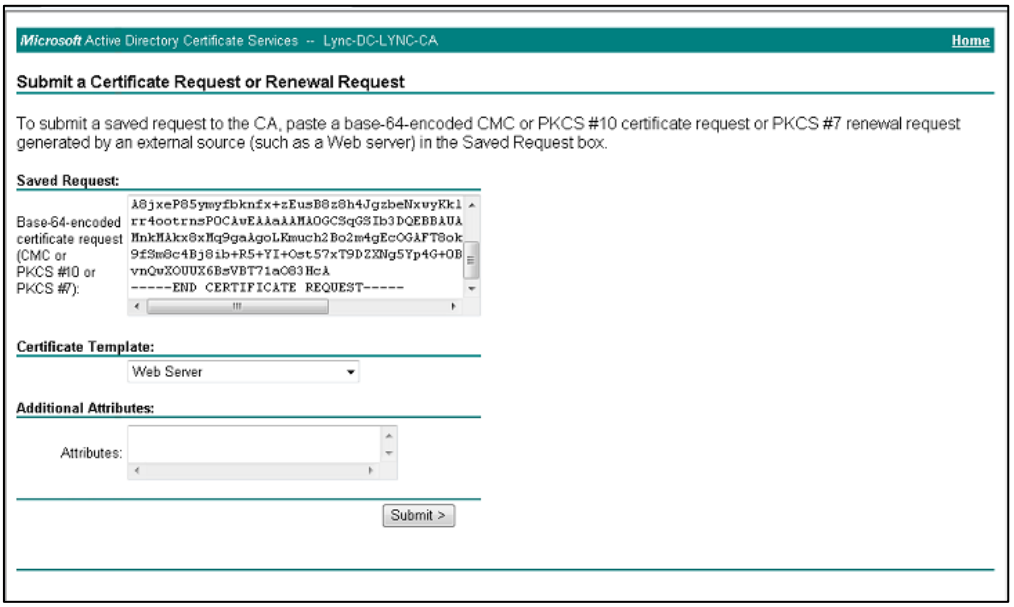
7. Click **advanced certificate request**, and then click **Next**.

Figure 4-28: Advanced Certificate Request Page



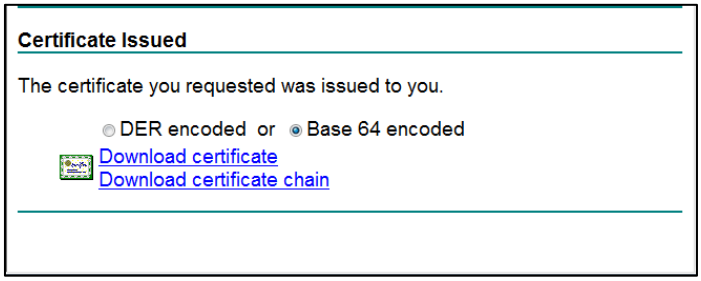
8. Click **Submit a certificate request ...**, and then click **Next**.

Figure 4-29: Submit a Certificate Request or Renewal Request Page



9. Open the *certreq.txt* file that you created and saved in Step 4, and then copy its contents to the 'Saved Request' field.
10. From the 'Certificate Template' drop-down list, select **Web Server**.
11. Click **Submit**.

Figure 4-30: Certificate Issued Page

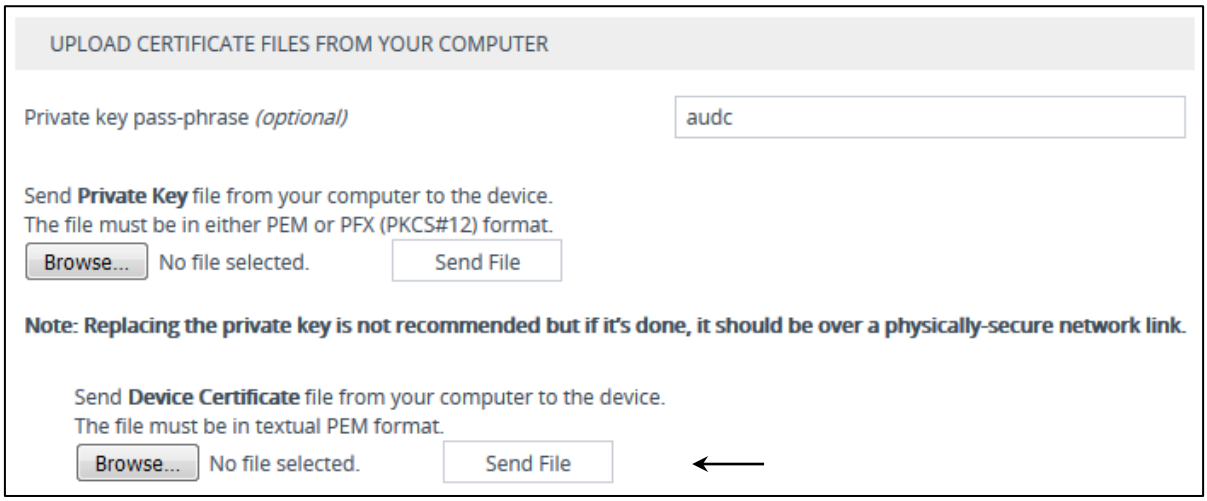


12. Select the **Base 64 encoded** option for encoding, and then click **Download certificate**.
13. Save the file as *gateway.cer* to a folder on your computer.
14. Click the **Home** button or navigate to the certificate server at http://<Certificate Server>/CertSrv.
15. Click **Download a CA certificate**, **certificate chain, or CRL**.

Figure 4-31: Download a CA Certificate, Certificate Chain, or CRL Page

16. Under the 'Encoding method' group, select the **Base 64** option for encoding.
17. Click **Download CA certificate**.
18. Save the file as *certroot.cer* to a folder on your computer.
19. In the E-SBC's Web interface, return to the **TLS Contexts** page and do the following:
    a. In the TLS Contexts page, select the required TLS Context index row, and then click the **Change Certificate** link located below the table; the Context Certificates page appears.
    b. Scroll down to the **Upload certificates files from your computer** group, click the **Browse** button corresponding to the **'Send Device Certificate**...' field, navigate to the *gateway.cer* certificate file that you saved on your computer in Step 13, and then click **Send File** to upload the certificate to the E-SBC.

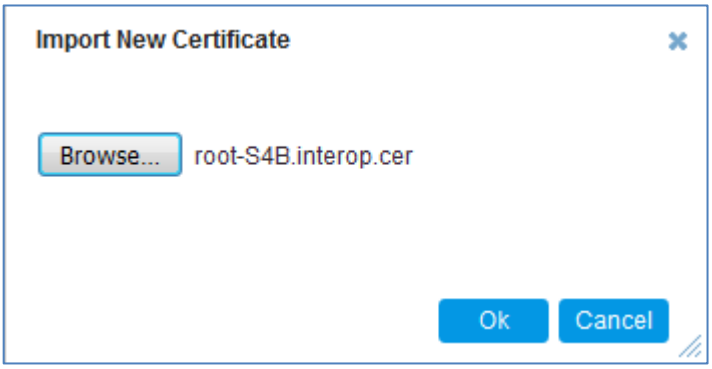
Figure 4-32: Upload Device Certificate Files from your Computer Group



20. In the E-SBC's Web interface, return to the **TLS Contexts** page.
    a. In the TLS Contexts page, select the required TLS Context index row, and then click the **Trusted Root Certificates** link, located at the bottom of the TLS Contexts page; the Trusted Certificates page appears.

b. Click the **Import** button, and then select the certificate file to load.

Figure 4-33: Importing Root Certificate into Trusted Certificates Store



21. Click **OK**; the certificate is loaded to the device and listed in the Trusted Certificates store.
22. Reset the E-SBC with a burn to flash for your settings to take effect (see Section 4.16 on page 78).

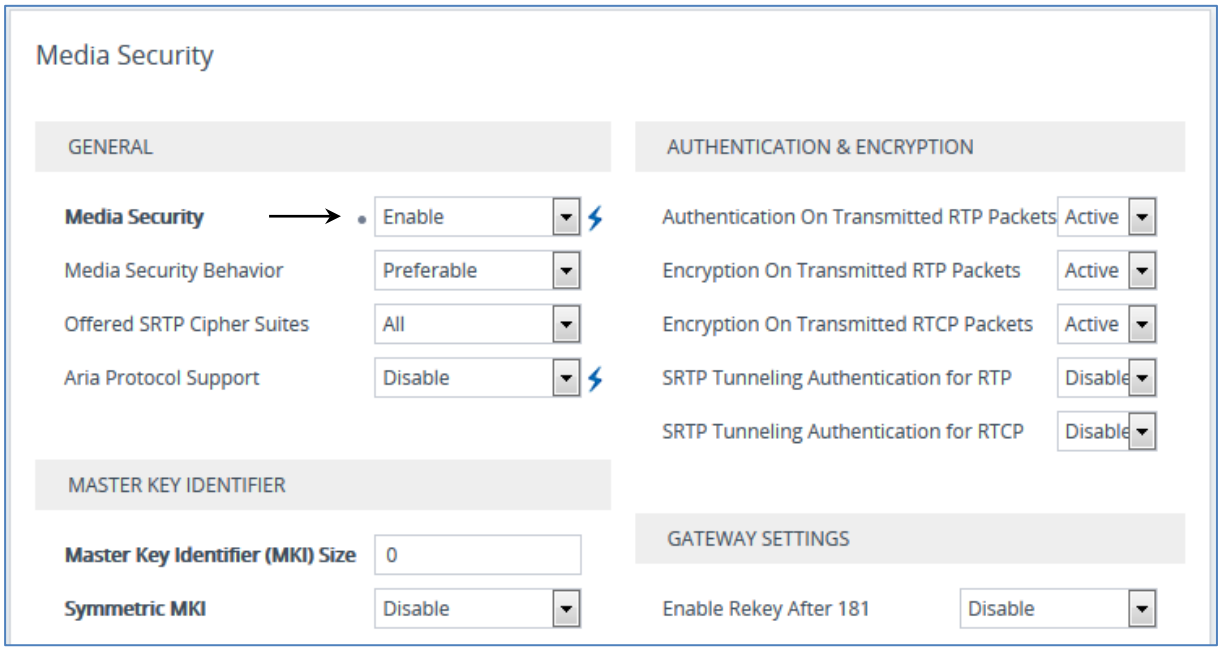
4.10 Step 10: Configure SRTP

This step describes how to configure media security. If you configure the Microsoft Mediation Server to use SRTP, you need to configure the E-SBC to operate in the same manner. Note that SRTP was enabled for Skype for Business Server 2015 when you configured an IP Profile for Skype for Business Server 2015 (see Section 4.6 on page 44).

➢ **To configure media security:**

1. Open the Media Security page (**Setup** menu > **Signaling & Media** tab > **Media** folder > **Media Security**).

Figure 4-34: Configuring SRTP



2. From the 'Media Security' drop-down list, select **Enable** to enable SRTP.
3. Click **Apply**.
4. Reset the E-SBC with a burn to flash for your settings to take effect (see Section 4.16 on page 78).

4.11 Step 11: Configure Maximum IP Media Channels

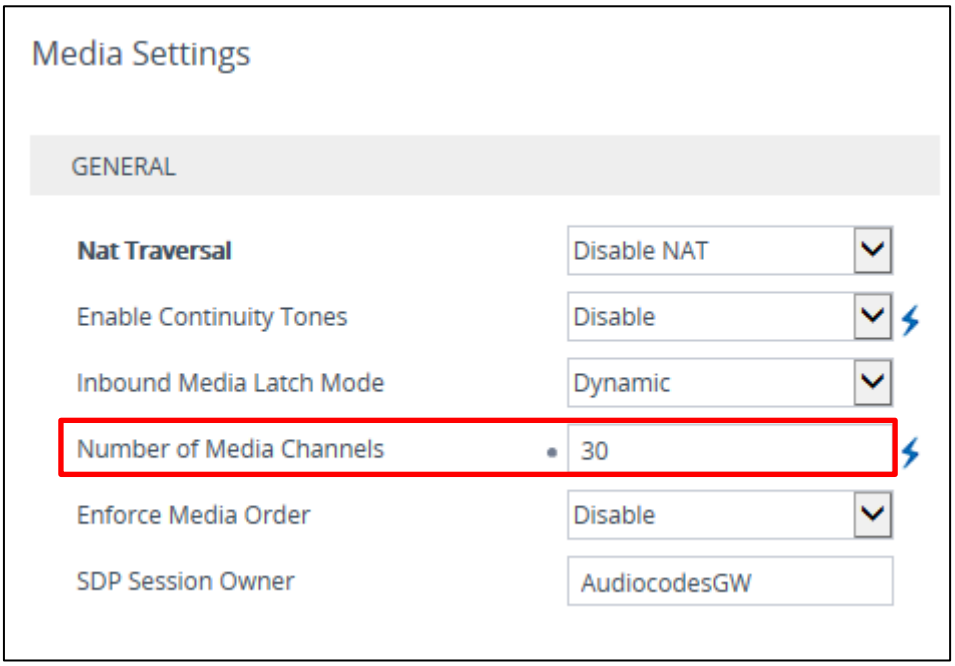
This step describes how to configure the maximum number of required IP media channels. The number of media channels represents the number of DSP channels that the E-SBC allocates to call sessions.

Note: This step is required **only** if transcoding is required.

➢ **To configure the maximum number of IP media channels:**

1. Open the Media Settings page (**Setup** menu > **Signaling & Media** tab > **Media** folder > **Media Settings**).

Figure 4-35: Configuring Number of Media Channels



2. In the 'Number of Media Channels' field, enter the number of media channels according to your environments transcoding calls (e.g., **30**).
3. Click **Apply**.
4. Reset the E-SBC with a burn to flash for your settings to take effect (see Section 4.16 on page 78).

4.12 Step 12: Configure IP-to-IP Call Routing Rules

This step describes how to configure IP-to-IP call routing rules. These rules define the routes for forwarding SIP messages (e.g., INVITE) received from one IP entity to another. The E-SBC selects the rule whose configured input characteristics (e.g., IP Group) match those of the incoming SIP message. If the input characteristics do not match the first rule in the table, they are compared to the second rule, and so on, until a matching rule is located. If no rule is matched, the message is rejected. The routing rules use the configured IP Groups (as configured in Section 4.8 on page 43,) to denote the source and destination of the call.

For the interoperability test topology, the following IP-to-IP routing rules need to be configured to route calls between Skype for Business Server 2015 (LAN) and 8BVodafone DE "IP Anlagen-Anschluss" SIP Trunk (DMZ):

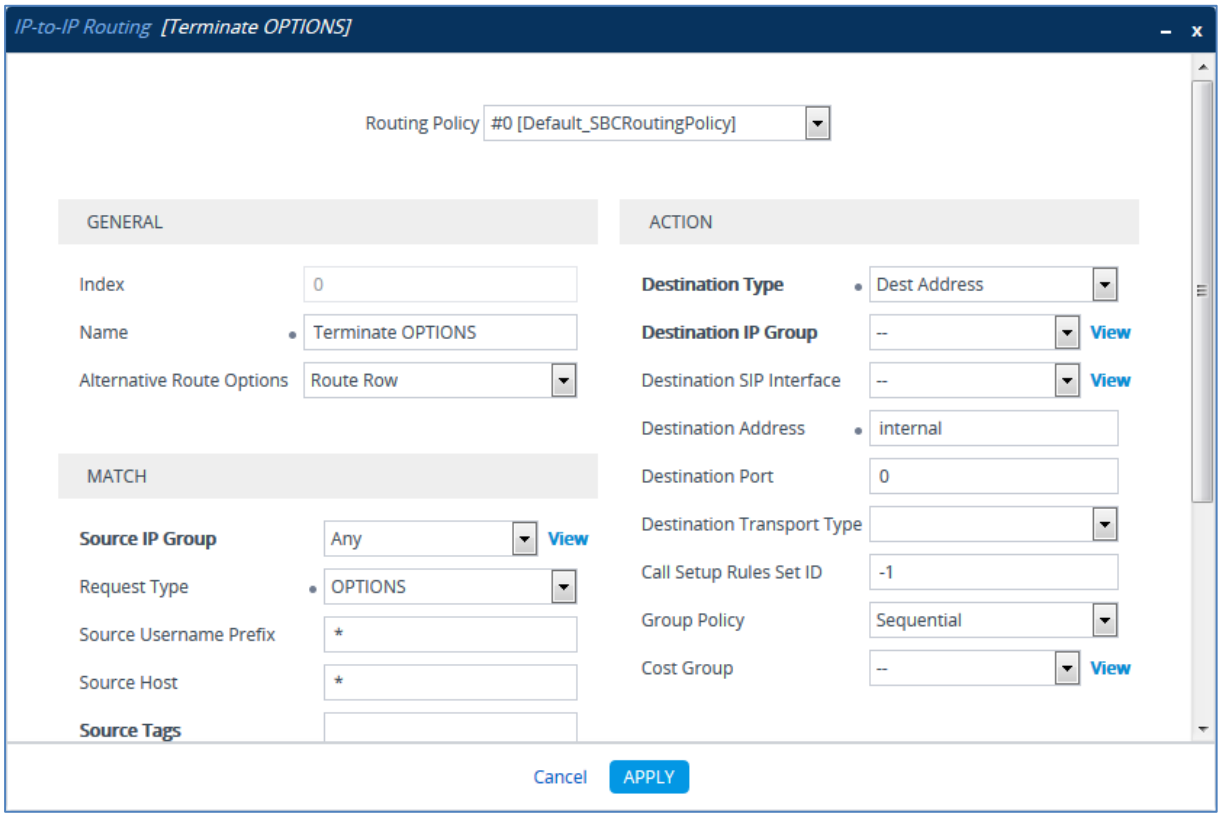
- Terminate SIP OPTIONS messages on the E-SBC that are received from the both LAN and DMZ
- Calls from Skype for Business Server 2015 to 8BVodafone DE "IP Anlagen-Anschluss" SIP Trunk
- Calls from 8BVodafone DE "IP Anlagen-Anschluss" SIP Trunk to Skype for Business Server 2015

➢ **To configure IP-to-IP routing rules:**

1. Open the IP-to-IP Routing table (**Setup** menu > **Signaling & Media** tab > **SBC** folder > **Routing** > **IP-to-IP Routing**).
2. Configure a rule to terminate SIP OPTIONS messages received from the both LAN and DMZ:
   a. Click **New**, and then configure the parameters as follows:

Parameter	Value
Index	**0**
Name	**Terminate OPTIONS** (arbitrary descriptive name)
Source IP Group	**Any**
Request Type	**OPTIONS**
Destination Type	**Dest Address**
Destination Address	**internal**

Figure 4-36: Configuring IP-to-IP Routing Rule for Terminating SIP OPTIONS



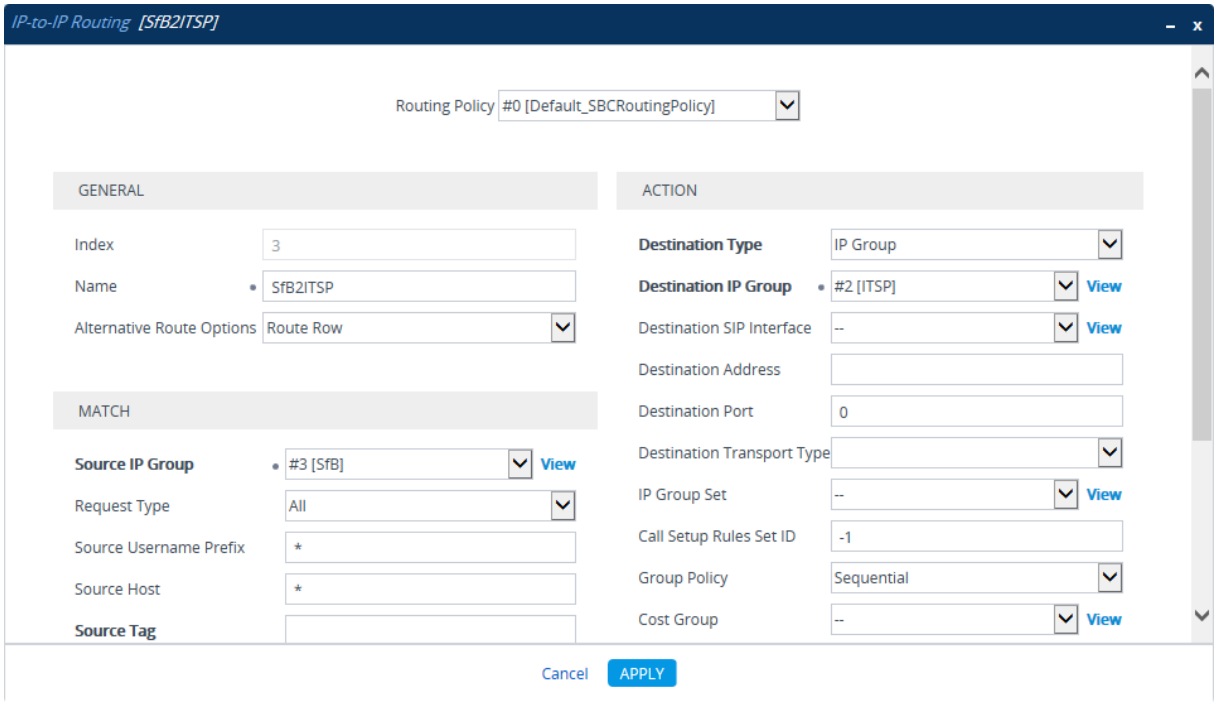
b. Click **Apply**.

3. Configure a rule to route calls from Skype for Business Server 2015 to 8BVodafone DE "IP Anlagen-Anschluss" SIP Trunk:

a. Click **New**, and then configure the parameters as follows:

Parameter	Value
Index	**3**
Route Name	**SfB2ITSP** (arbitrary descriptive name)
Source IP Group	**#3 [SfB]**
Destination Type	**IP Group**
Destination IP Group	**#2 [ITSP]**

Figure 4-37: Configuring IP-to-IP Routing Rule for S4B to ITSP



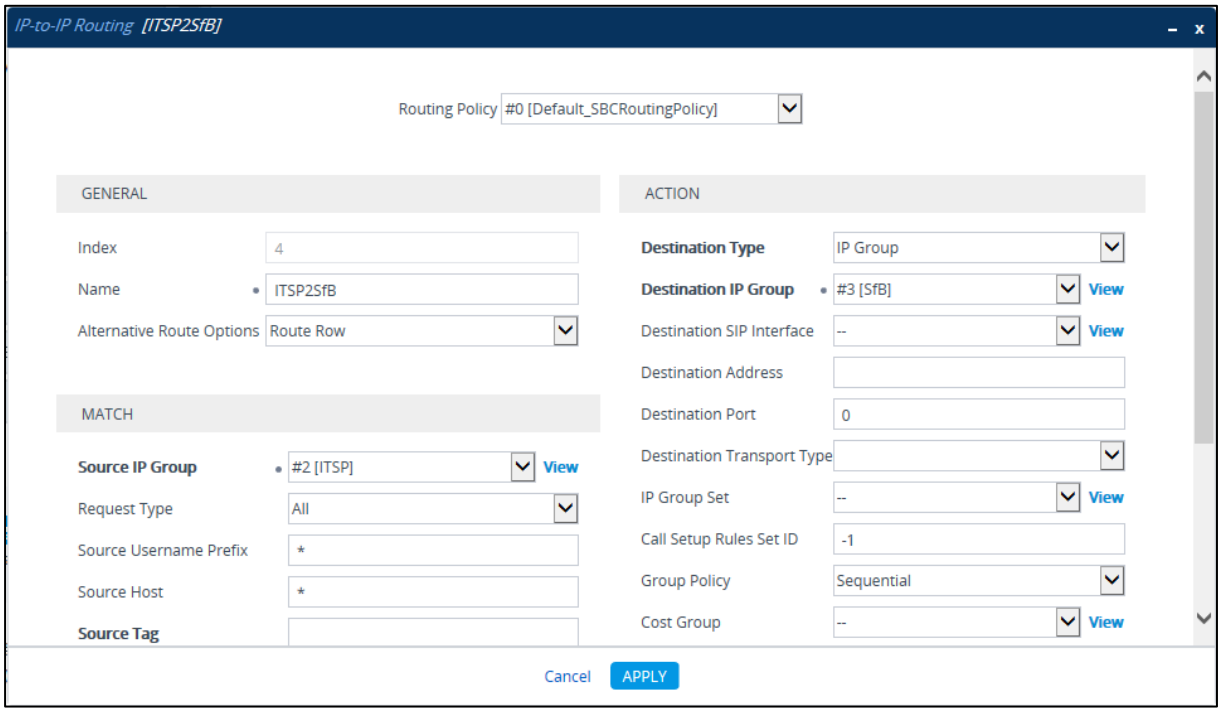
b. Click **Apply**.

4. Configure rule to route calls from 8BVodafone DE "IP Anlagen-Anschluss" SIP Trunk to Skype for Business Server 2015:

a. Click **New**, and then configure the parameters as follows:

Parameter	Value
Index	**4**
Route Name	**ITSP2SfB** (arbitrary descriptive name)
Source IP Group	**#2 [ITSP]**
Destination Type	**IP Group**
Destination IP Group	**#3 [SfB]**

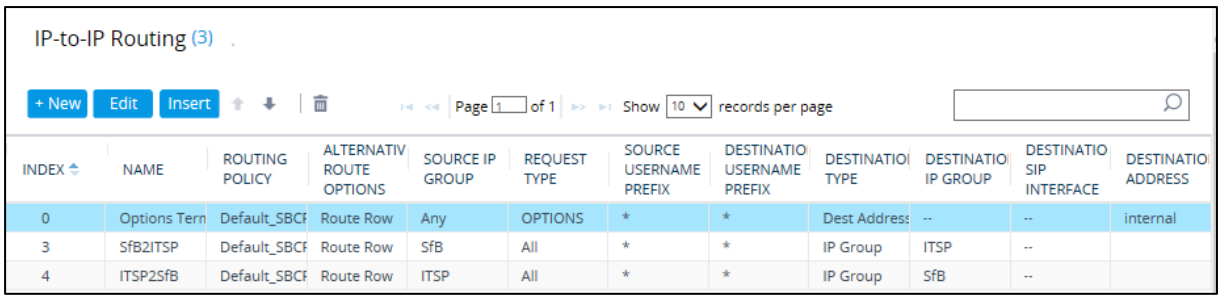
Figure 4-38: Configuring IP-to-IP Routing Rule for ITSP to S4B



b. Click **Apply.**

The configured routing rules are shown in the figure below:

Figure 4-39: Configured IP-to-IP Routing Rules in IP-to-IP Routing Table



INDEX	NAME	ROUTING POLICY	ALTERNATIV ROUTE OPTIONS	SOURCE IP GROUP	REQUEST TYPE	SOURCE USERNAME PREFIX	DESTINATIO USERNAME PREFIX	DESTINATIO TYPE	DESTINATIO IP GROUP	DESTINATIO SIP INTERFACE	DESTINATIO ADDRESS
0	Options Tern	Default_SBCF	Route Row	Any	OPTIONS	*	*	Dest Address	--	--	internal
3	SfB2ITSP	Default_SBCF	Route Row	SfB	All	*	*	IP Group	ITSP	--	
4	ITSP2SfB	Default_SBCF	Route Row	ITSP	All	*	*	IP Group	SfB	--	

Note: The routing configuration may change according to your specific deployment topology.

4.13 Step 13: Configure IP-to-IP Manipulation Rules

This step describes how to configure IP-to-IP manipulation rules. These rules manipulate the SIP Request-URI user part (source or destination number). The manipulation rules use the configured IP Groups (as configured in Section 4.8 on page 43) to denote the source and destination of the call.

Note: Adapt the manipulation table according to your environment dial plan.

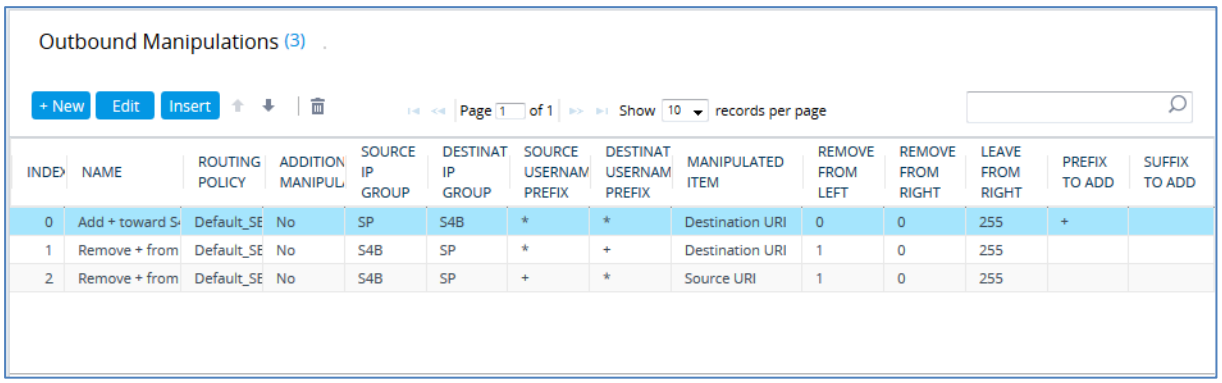
For example, for this interoperability test topology, a manipulation is configured to add the "+" (plus sign) to the destination number for calls from the 8BVodafone DE "IP Anlagen-Anschluss" SIP Trunk IP Group to the Skype for Business Server 2015 IP Group for any destination username prefix.

➢ **To configure a number manipulation rule:**

1. Open the Outbound Manipulations table (**Setup** menu > **Signaling & Media** tab > **SBC** folder > **Manipulation** > **Outbound Manipulations**).

The figure below shows an example of configured IP-to-IP outbound manipulation rules for calls between Skype for Business Server 2015 IP Group and 8BVodafone DE "IP Anlagen-Anschluss" SIP Trunk IP Group:

Figure 4-40: Example of Configured IP-to-IP Outbound Manipulation Rules



Rule Index	Description
1	Calls from ITSP IP Group to S4B IP Group with any destination number (*), add "+" to the prefix of the destination number.
2	Calls from S4B IP Group to ITSP IP Group with the prefix destination number "+", remove "+" from this prefix.
3	Calls from S4B IP Group to ITSP IP Group with source number prefix "+", remove the "+" from this prefix.

4.14 Step 14: Configure Message Manipulation Rules

This step describes how to configure SIP message manipulation rules. SIP message manipulation rules can include insertion, removal, and/or modification of SIP headers. Manipulation rules are grouped into Manipulation Sets, enabling you to apply multiple rules to the same SIP message (IP entity).

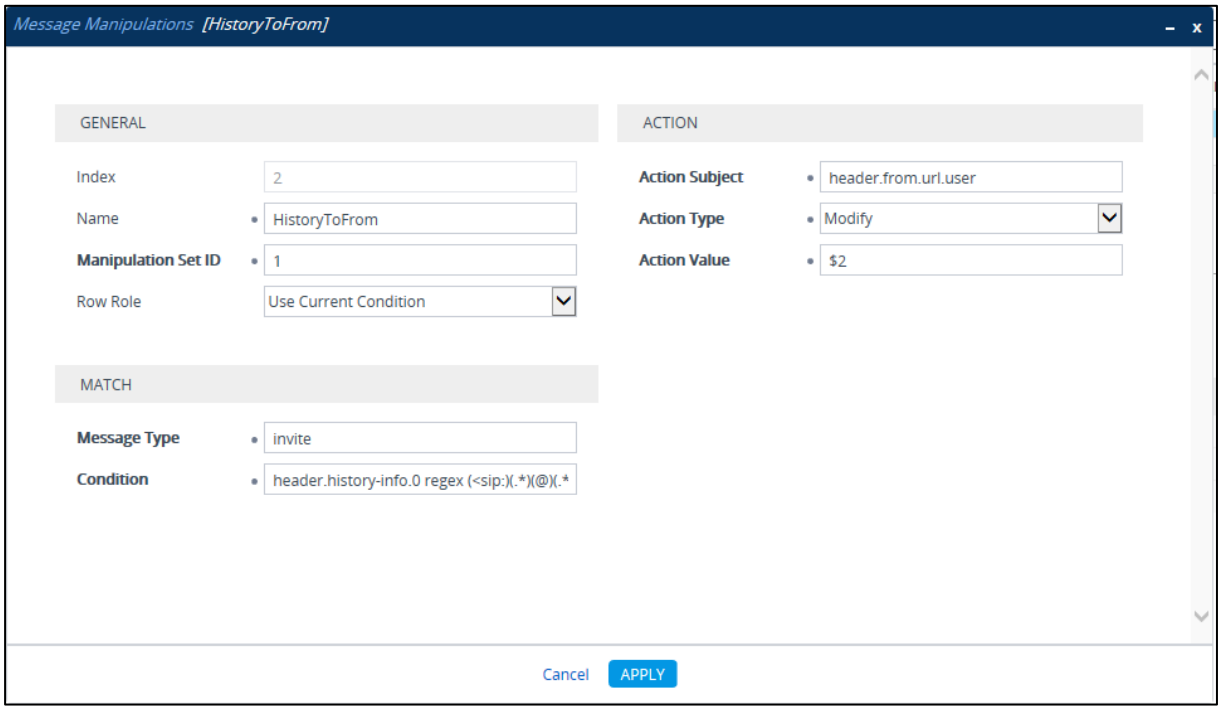
Once you have configured the SIP message manipulation rules, you need to assign them to the relevant IP Group (in the IP Group table) and determine whether they must be applied to inbound or outbound messages.

➢ **To configure SIP message manipulation rule:**

1. Open the Message Manipulations page (**Setup** menu > **Signaling & Media** tab > **Message Manipulation** folder > **Message Manipulations**).
2. Configure a new manipulation rule (Manipulation Set 1) for incoming messages from Skype for Business server. This rule applies to messages sent to the 8BVodafone DE "IP Anlagen-Anschluss" SIP Trunk IP Group in a call forward scenario. This replaces the user part of the SIP From Header with the value from the SIP History-Info Header.

Parameter	Value
Index	**2**
Name	**HistoryToFrom**
Manipulation Set ID	**1**
Message Type	**invite**
Condition	**header.history-info.0 regex (<sip:)(.*)(@)(.*)**
Action Subject	**header.from.url.user**
Action Type	**Modify**
Action Value	**$2**

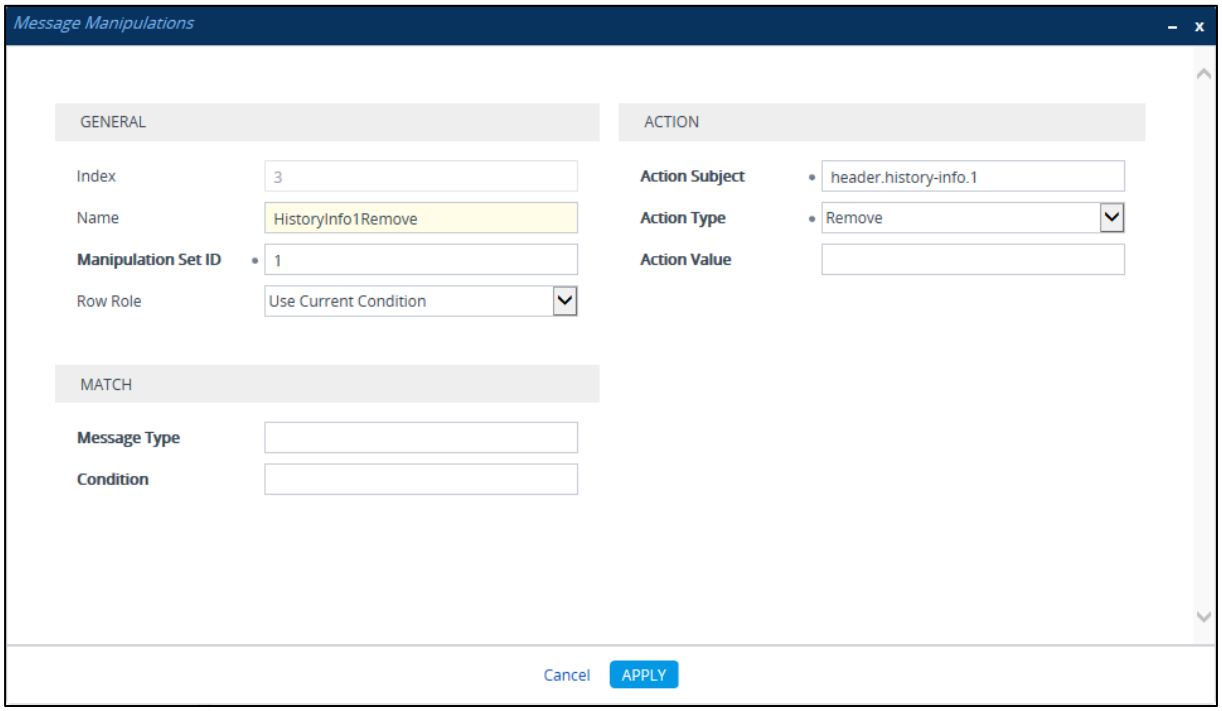
Figure 4-41: Configuring SIP Message Manipulation Rule 2 (for Skype for Business server)



3. Configure another manipulation rule (Manipulation Set 1) for incoming messages from Skype for Business server. This rule is applied to response messages sent to the 8BVodafone DE "IP Anlagen-Anschluss" SIP Trunk IP Group for removing the second line of the History header.

Parameter	Value
Index	**3**
Name	**HistoryInfo1Remove**
Manipulation Set ID	**1**
Message Type	
Condition	
Action Subject	**header.history-info.1**
Action Type	**Remove**
Action Value	

Figure 4-42: Configuring SIP Message Manipulation Rule 3 (for Skype for Business Server)



4. Configure another manipulation rule (Manipulation Set 4) for 8BVodafone DE "IP Anlagen-Anschluss" SIP Trunk. This rule is applied to response messages sent to the 8BVodafone DE "IP Anlagen-Anschluss" SIP Trunk IP Group to normalize the SDP before routing to ITSP.

Parameter	Value
Index	**5**
Name	**normalize**
Manipulation Set ID	**4**
Message Type	**invite**
Condition	
Action Subject	**body.sdp**
Action Type	**Normalize**
Action Value	

Figure 4-43: Configuring SIP Message Manipulation Rule 5 (for 8BVodafone DE "IP Anlagen-Anschluss" SIP Trunk)

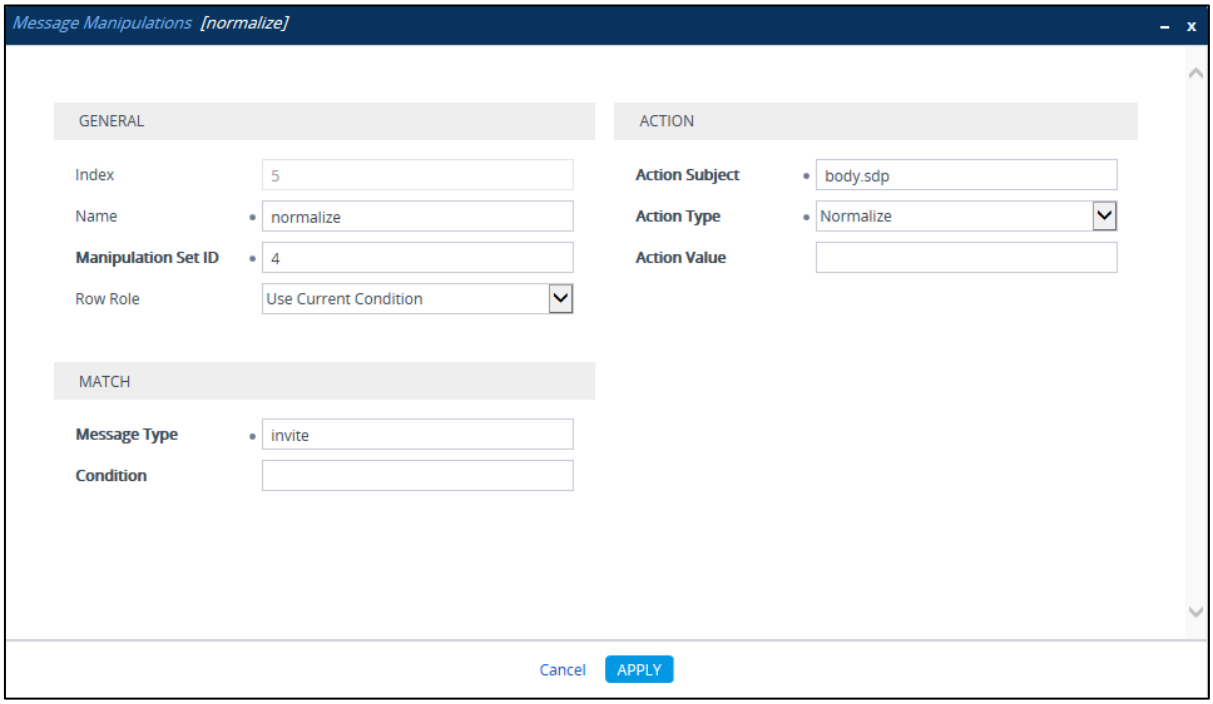


Figure 4-44: Example of Configured SIP Message Manipulation Rules

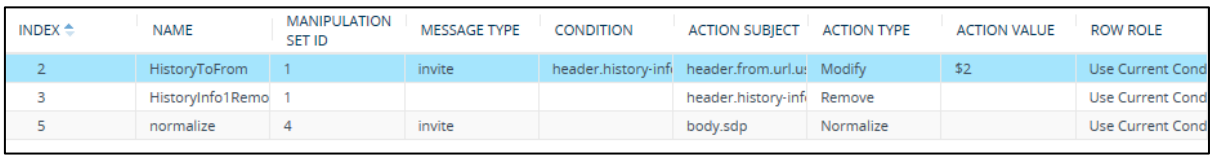


INDEX	NAME	MANIPULATION SET ID	MESSAGE TYPE	CONDITION	ACTION SUBJECT	ACTION TYPE	ACTION VALUE	ROW ROLE
2	HistoryToFrom	1	invite	header.history-infi	header.from.url.u:	Modify	$2	Use Current Cond
3	HistoryInfo1Remo	1			header.history-infi	Remove		Use Current Cond
5	normalize	4	invite		body.sdp	Normalize		Use Current Cond

The table displayed below includes SIP message manipulation rules grouped together under Manipulation Set IDs (Manipulation Set IDs 1 and 4) and which are executed for messages sent to and from the 8BVodafone DE "IP Anlagen-Anschluss" SIP Trunk IP Group as well as the Skype for Business Server 2015 IP Group. These rules are required to enable correct interworking between 8BVodafone DE "IP Anlagen-Anschluss" SIP Trunk and Skype for Business Server 2015. Refer to the *User's Manual* for further details concerning the full capabilities of header manipulation.

Rule Index	Rule Description	Reason for Introducing Rule
2	This rule applies to messages sent to the 8BVodafone DE "IP Anlagen-Anschluss" SIP Trunk IP Group in a call forward scenario. This replaces the user part of the SIP From Header with the value from the SIP History-Info Header.	For Call Forward scenarios, 8BVodafone DE "IP Anlagen-Anschluss" SIP Trunk needs the User part in the SIP From Header to be a defined number. To do this, the User part of the SIP From Header is replaced with the value from the History-Info Header.
3	If the manipulation rule Index 0 (above) is executed, then the following rule is also executed. It removes History Info Header.	

Rule Index	Rule Description	Reason for Introducing Rule
5	This rule applies to the SDP of the SIP message. It normalizes the SDP according to the basic SIP requirement, because Skype for Business has added additional parameters that must be removed before sending to the 8BVodafone DE "IP Anlagen-Anschluss" SIP Trunk.	In the Call Park scenario and the forward scenario, Microsoft added additional parameters to SDP that need to be removed before sending to Vodafone DE.

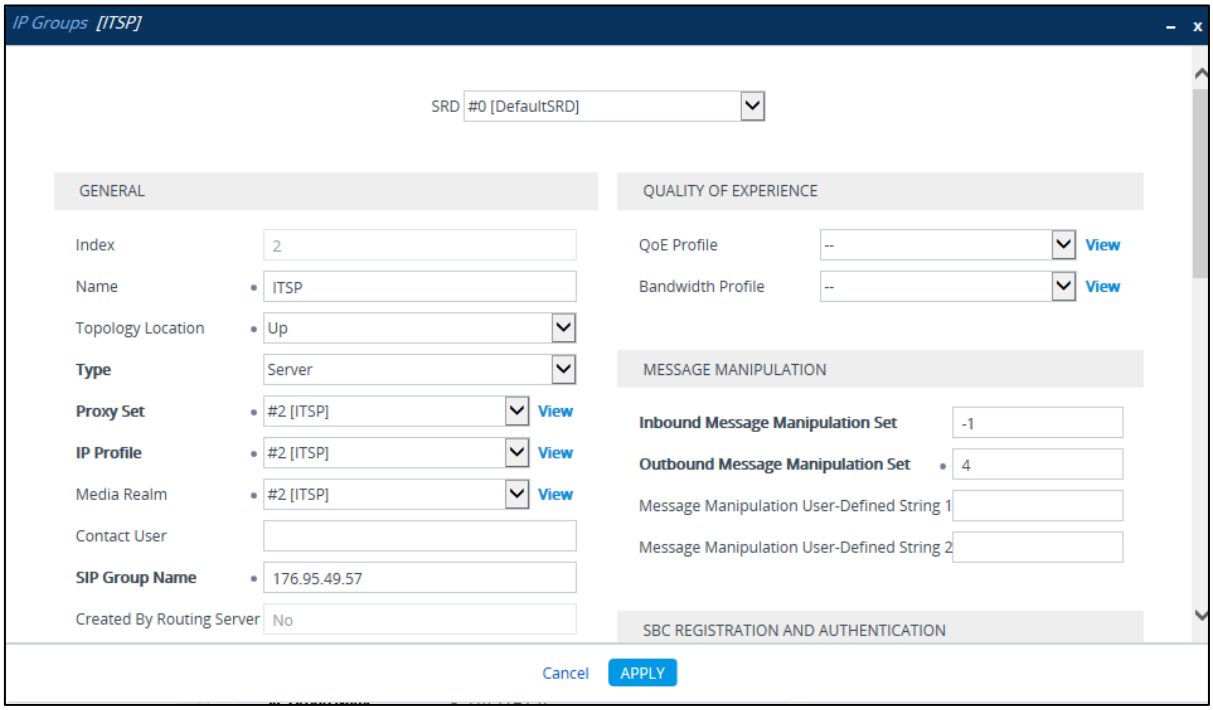
5. Assign Manipulation Set ID 1 to the Skype for Business 2015 IP Group:
   a. Open the IP Groups table (**Setup** menu > **Signaling & Media** tab > **Core Entities** folder > **IP Groups**).
   b. Select the row of the Skype for Business 2015 IP Group, and then click **Edit**.
   c. Set the 'Inbound Message Manipulation Set' field to **1**.

Figure 4-45: Assigning Manipulation Set to the Skype for Business 2015 IP Group

   d. Click **Apply**.

6. Assign Manipulation Set ID 4 to the 8BVodafone DE "IP Anlagen-Anschluss" SIP trunk IP Group:
   a. Open the IP Groups table (**Setup** menu > **Signaling & Media** tab > **Core Entities** folder > **IP Groups**).
   b. Select the row of the 8BVodafone DE "IP Anlagen-Anschluss" SIP trunk IP Group, and then click **Edit**.
   c. Set the 'Outbound Message Manipulation Set' field to **4**.

Figure 4-46: Assigning Manipulation Set 4 to the 8BVodafone DE "IP Anlagen-Anschluss" SIP Trunk IP Group



d. Click **Apply**.

4.15 Step 15: Miscellaneous Configuration

This section describes miscellaneous E-SBC configuration.

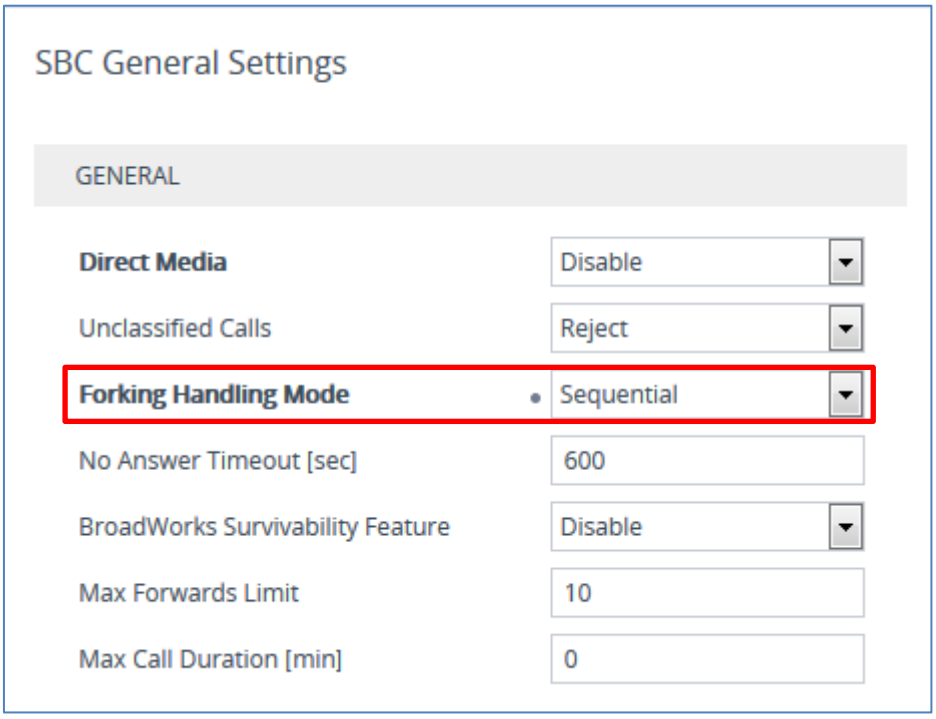
4.15.1 Step 15a: Configure Call Forking Mode

This step describes how to configure the E-SBC's handling of SIP 18x responses received for call forking of INVITE messages. For the interoperability test topology, if a SIP 18x response with SDP is received, the E-SBC opens a voice stream according to the received SDP. The E-SBC re-opens the stream according to subsequently received 18x responses with SDP or plays a ringback tone if a 180 response without SDP is received. It is mandatory to set this field for the Skype for Business Server 2015 environment.

➢ **To configure call forking:**

1. Open the SBC General Settings page (**Setup** menu > **Signaling & Media** tab > **SBC** folder > **SBC General Settings**).
2. From the 'SBC Forking Handling Mode' drop-down list, select **Sequential**.

Figure 4-47: Configuring Forking Mode



3. Click **Apply**.

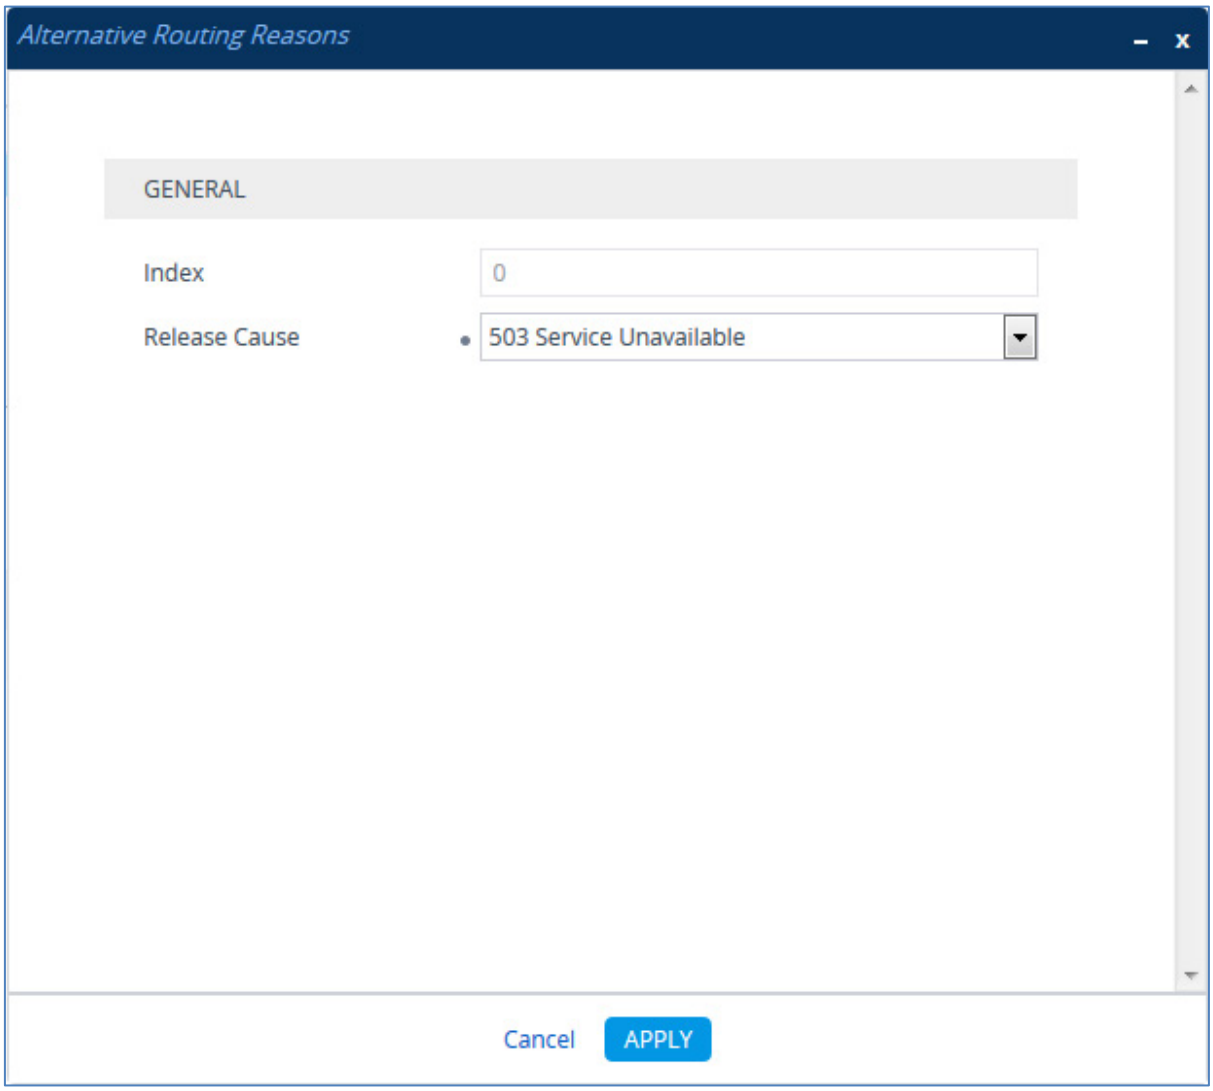
4.15.2 Step 15b: Configure SBC Alternative Routing Reasons

This step describes how to configure the E-SBC's handling of SIP 503 responses received for outgoing SIP dialog-initiating methods, e.g., INVITE, OPTIONS, and SUBSCRIBE messages. In this case E-SBC attempts to locate an alternative route for the call.

➢ **To configure SIP reason codes for alternative IP routing:**

1. Open the Alternative Routing Reasons table (**Setup** menu > **Signaling & Media** tab > **SBC** folder > **Routing** > **Alternative Reasons**).
2. Click **New**.
3. From the 'Release Cause' drop-down list, select **503 Service Unavailable**.

Figure 4-48: SBC Alternative Routing Reasons Table



4. Click **Apply**.

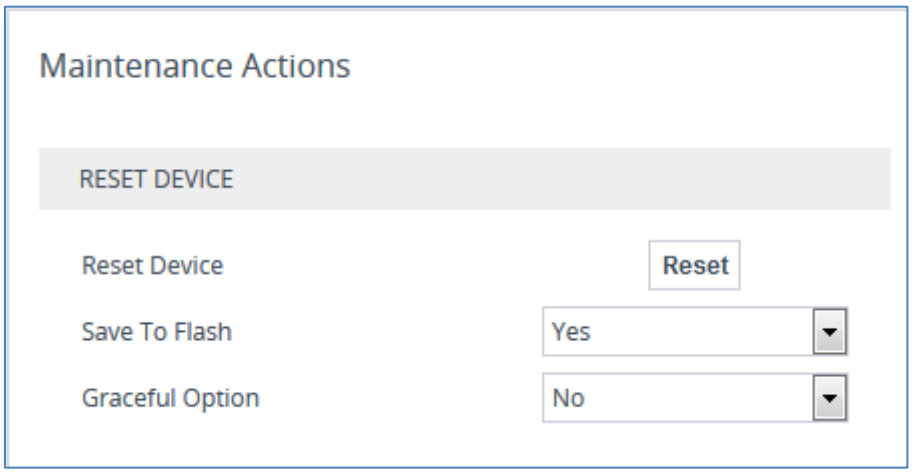
4.16 Step 16: Reset the E-SBC

After you have completed the configuration of the E-SBC described in this chapter, save ("burn") the configuration to the E-SBC's flash memory with a reset for the settings to take effect.

➢ **To reset the device through Web interface:**

1. Open the Maintenance Actions page (**Setup** menu > **Administration** tab > **Maintenance** folder > **Maintenance Actions**).

Figure 4-49: Resetting the E-SBC



2. Ensure that the ' Save To Flash' field is set to **Yes** (default).
3. Click the **Reset** button; a confirmation message box appears, requesting you to confirm.
4. Click **OK** to confirm device reset.

A AudioCodes ini File

The *ini* configuration file of the E-SBC, corresponding to the Web-based configuration as described in Section 4, is shown below:

Note: To load or save an *ini* file, use the Configuration File page (**Setup** menu > **Administration** tab > **Maintenance** folder > **Configuration File**).

```
